Chip Compatibility	15

Part I: Concept and Development Information

1. Introduction to Home Automation	19
1.1 Wireless Home Automation	19
1.2 Home Automation Benefits	20
1.3 Home Automation Application Areas	20
1.3.1 Lighting	20
1.3.2 Heating, Ventilation and Air-Conditioning (HVAC)	21
1.3.3 Shades and Window Coverings	21
1.3.4 Security Systems	21
1.4 Energy Saving	22
1.5 ZigBee Wireless Networks	22
1.6 Software Architecture	23
1.7 Interoperability and Certification	23
1.8 Commissioning	24
1.9 Internet Connectivity	24
2. Home Automation (HA) Profile	25
2.1 HA Devices	25
2.2 Common Clusters	26
2.3 Generic Devices	27
2.3.1 On/Off Switch	28
2.3.2 On/Off Output	29
2.3.3 Remote Control	30
2.3.4 Door Lock	31
2.3.5 Door Lock Controller	32
2.3.6 Simple Sensor	33
2.3.7 Smart Plug	34

Contents

2.4 Lighting Devices	35
2.4.1 On/Off Light	36
2.4.2 Dimmable Light	37
2.4.3 Colour Dimmable Light	38
2.4.4 On/Off Light Switch	39
2.4.5 Dimmer Switch	40
2.4.6 Colour Dimmer Switch	41
2.4.7 Light Sensor	42
2.4.8 Occupancy Sensor	43
2.5 HVAC Devices	43
2.5.1 Thermostat	44
2.6 Intruder Alarm System (IAS) Devices	45
2.6.1 IAS Control and Indicating Equipment (CIE)	46
2.6.2 IAS Ancillary Control Equipment (ACE)	47
2.6.3 IAS Zone	48
2.6.4 IAS Warning Device (WD)	49
3. HA Application Development	51
3.1 Development Resources and Installation	51
3.2 HA Programming Resources	52
3.2.1 Core Resources	52
3.2.2 Cluster-specific Resources	52
3.3 Function Prefixes	53
3.4 Development Phases	53
3.5 Building an Application	54
3.5.1 Compile-Time Options	54
3.5.2 ZigBee Network Parameters	55
3.5.3 Building and Loading the Application Binary	55
4. HA Application Coding	57
4.1 HA Programming Concepts	57
4.1.1 Shared Device Structures	57
4.1.2 Addressing	59
4.1.3 OS Resources	59
4.2 Initialisation	60
4.3 Callback Functions	61
4.4 Discovering Endpoints and Clusters	62
4.5 Reading Attributes	63
4.6 Writing Attributes	65
4.7 Handling Stack and Timer Events	68
4.8 Servicing Timing Requirements	69
4.9 Time Management	69

4.9.1 Time Maintenance	70
4.9.2 Updating ZCL Time Following Sleep	71

Part II: HA Clusters

5. General Clusters	75
5.1 ZCL Clusters	75
5.1.1 Basic Cluster	76
5.1.2 Power Configuration Cluster	76
5.1.3 Identify Cluster	77
5.1.4 Groups Cluster	77
5.1.5 Scenes Cluster	78
5.1.6 On/Off Cluster	78
5.1.7 On/Off Switch Configuration Cluster	79
5.1.8 Level Control Cluster	79
5.1.9 Time Cluster	80
5.1.10 Binary Input (Basic) Cluster	80
5.1.11 Door Lock Cluster	80
5.1.12 Thermostat Cluster	81
5.1.13 Thermostat User Interface (UI) Cluster	81
5.1.14 Colour Control Cluster	81
5.1.15 Illuminance Measurement Cluster	82
5.1.16 Illuminance Level Sensing Cluster	82
5.1.17 Temperature Measurement Cluster	82
5.1.18 Relative Humidity Measurement Cluster	83
5.1.19 Occupancy Sensing Cluster	83
5.1.20 IAS Zone Cluster	83
5.1.21 IAS Ancillary Control Equipment (ACE) Cluster	84
5.1.22 IAS Warning Device (WD) Cluster	84
5.2 SE Clusters	84
5.2.1 Price Cluster	85
5.2.2 Demand-Response and Load Control (DRLC) Cluster	85
5.2.3 Simple Metering Cluster	85
6. Poll Control Cluster	87
6.1 Overview	87
6.2 Cluster Structure and Attributes	88
6.3 Attribute Settings	89
6.4 Poll Control Operations	90
6.4.1 Initialisation	90
6.4.2 Configuration	90
6.4.3 Operation	92
6.4.3.1 Fast Poll Mode Timeout	93
6.4.3.2 Invalid Check-in Responses	93

Contents

6.5 Poll Control Events	94
6.6 Functions	95
6.6.1 Server/Client Function	95
eCLD_PollControlCreatePollControl	96
6.6.2 Server Functions	98
eCLD_PollControlUpdate	99
eCLD_PollControlSetAttribute	100
6.6.3 Client Functions	101
eCLD_PollControlSetLongPollIntervalSend	102
eCLD_PollControlSetShortPollIntervalSend	104
eCLD_PollControlFastPollStopSend	106
6.7 Return Codes	107
6.8 Enumerations	107
6.8.1 'Attribute ID' Enumerations	107
6.8.2 'Command' Enumerations	107
6.9 Structures	108
6.9.1 tsCLD_PPCallBackMessage	108
6.9.2 tsCLD_PollControl_CheckinResponsePayload	109
6.9.3 tsCLD_PollControl_SetLongPollIntervalPayload	109
6.9.4 tsCLD_PollControl_SetShortPollIntervalPayload	110
6.9.5 tsCLD_PollControlCustomDataStructure	110
6.10 Compile-Time Options	110
7. Power Profile Cluster	113
7.1 Overview	113
7.2 Cluster Structure and Attributes	113
7.3 Power Profiles	115
7.4 Power Profile Operations	116
7.4.1 Initialisation	116
7.4.2 Adding and Removing a Power Profile (Server Only)	116
7.4.2.1 Adding a Power Profile Entry	116
7.4.2.2 Removing a Power Profile Entry	117
7.4.2.3 Obtaining a Power Profile Entry	117
7.4.3 Communicating Power Profiles	117
7.4.3.1 Requesting a Power Profile (by Client)	117
7.4.3.2 Notification of a Power Profile (by Server)	118
7.4.4 Communicating Schedule Information	118
7.4.4.1 Requesting a Schedule (by Server)	119
7.4.4.2 Notification of a Schedule (by Client)	119
7.4.4.3 Notification of Energy Phases in Power Profile Schedule (by Server)	120
7.4.4.4 Requesting the Scheduled Energy Phases (by Client)	120
7.4.5 Executing a Power Profile Schedule	120
7.4.6 Communicating Price Information	121
7.4.6.1 Requesting Cost of a Power Profile Schedule (by Server)	122
7.4.6.2 Requesting Cost of Power Profile Schedules Over a Day (by Server)	122

7.5 Power Profile Events	123
7.6 Functions	126
7.6.1 Server/Client Function	126
eCLD_PPCreatePowerProfile	127
7.6.2 Server Functions	129

14.4.4 tsHA_IASWarningDevice	341

Part IV: Appendices

A. Custom Endpoints	347
A.1 HA Devices and Endpoints	347
A.2 Cluster Creation Functions	348
A.3 Custom Endpoint Set-up	349

Preface

This manual provides an introduction to the ZigBee Home Automation (HA) application profile and describes the use of the NXP HA Application Programming Interface (API) for the JN5168 and JN5169 wireless microcontrollers. The manual contains both operational and reference information relating to the HA API, including descriptions of the C functions and associated resources (e.g. structures).

Note: Many of the clusters used by the devices in the HA profile are from the ZigBee Cluster Library (ZCL). These clusters are fully detailed in the *ZCL User Guide (JN-UG-3103)*, available from the NXP web site (see [“Support Resources” on page 15](#)).

The API is designed for use with the NXP ZigBee PRO stack to develop wireless network applications based on the ZigBee Home Automation application profile. For complementary information, refer to the following sources:

- Information on ZigBee PRO wireless networks is provided in the *ZigBee PRO Stack User Guide (JN-UG-3101)*, available from NXP.
- The ZigBee HA profile is defined in the *ZigBee Home Automation Profile Specification (053520)*, available from the ZigBee Alliance at www.zigbee.org.

Organisation

This manual is divided into four parts:

- **Part I: Concept and Development Information** comprises four chapters:
 - [Chapter 1](#) introduces the principles of Home Automation (HA)
 - [Chapter 2](#) describes the devices available in the ZigBee HA application profile
 - [Chapter 3](#) provides an overview of HA application development
 - [Chapter 4](#) describes the essential aspects of coding an HA application
- **Part II: HA Clusters** comprises eight chapters:
 - [Chapter 5](#) outlines the clusters from the ZigBee Cluster Library (ZCL) and Smart Energy (SE) profile that are used in the HA profile
 - [Chapter 6](#) describes the Poll Control cluster of the HA profile
 - [Chapter 7](#) describes the Power Profile cluster of the HA profile
 - [Chapter 8](#) describes the Appliance Control cluster of the HA profile
 - [Chapter 9](#) describes the Appliance Identification cluster of the HA profile
 - [Chapter 10](#) describes the Appliance Events and Alerts cluster of the HA profile

- [Chapter 11](#) describes the Appliance Statistics cluster of the HA profile
- [Chapter 12](#) describes the Electrical Measurement cluster of the HA profile
- [Part III: General Reference Information](#) comprises two chapters:
 - [Chapter 13](#) details the core functions of the HA API, including initialisation and device registration functions
 - [Chapter 14](#) details the device structures included in the HA API
- [Part IV: Appendices](#) contains an appendix which describes how to set up custom endpoints.

Conventions

Files, folders, functions and parameter types are represented in **bold** type.

Function parameters are represented in *italics* type.

Code fragments are represented in the `Courier New` typeface.

This is a **Tip**. It indicates useful or practical information.

This is a **Note**. It highlights important additional information.

*This is a **Caution**. It warns of situations that may result in equipment malfunction or damage.*

Acronyms and Abbreviations

ACE	Ancillary Control Equipment
APDU	Application Protocol Data Unit
API	Application Programming Interface
CIE	Control and Indicating Equipment
DRLC	Demand-Response and Load Control
HA	Home Automation
IAS	Intruder Alarm System

SDK	Software Developer's Kit
WD	Warning Device
ZCL	ZigBee Cluster Library

Support Resources

To access online support resources such as SDKs, Application Notes and User Guides, visit the Wireless Connectivity area of the NXP web site:

www.nxp.com/products/interface-and-connectivity/wireless-connectivity

ZigBee resources can be accessed from the ZigBee page, which can be reached via the short-cut www.nxp.com/zigbee.

All NXP resources referred to in this manual can be found at the above addresses, unless otherwise stated.

Trademarks

All trademarks are the property of their respective owners.

Chip Compatibility

The ZCL software described in this manual can be used on the NXP JN516x family of wireless microcontrollers with the exception of the JN5164 and JN5161 devices. However, the supported devices will be referred to as JN516x.

Part I: Concept and Development Information

1. Introduction to Home Automation

Home automation is not new! Throughout history, we have continuously strived to automate tasks in the home in order to make our lives easier. Technology has now advanced to the point at which we wish to take an integrated approach to home automation, allowing appliances to communicate with each other and to be controlled in flexible ways. A wireless network approach to this communication and control provides an easy, cost-effective and scalable solution to home automation.

1.1 Wireless Home Automation

A network approach to home automation allows a diverse range of potential applications, including:

- Lighting
- Heating and cooling
- Shades, blinds and curtains
- Home security

Possible application areas of home automation are described in [Section 1.3](#).

Multiple home automation applications can be controlled through the same network infrastructure. However, the installation of a wired home automation network is costly and disruptive unless carried out during the construction or refurbishment of the building. The advantages of a radio-based wireless home automation network are:

- No expensive and disruptive network wiring to be installed in the building
- Can be easily and cheaply installed at any time with minimal disruption
- Can be expanded, as required, at any time to cover a wider physical area
- Can be scaled, as required, at any time to incorporate more application areas

The ZigBee Home Automation (HA) application profile, described in this manual, facilitates this wireless networking solution.

Note: Not all of the application areas covered by the ZigBee Home Automation profile are currently supported by the HA profile from NXP - see [Section 1.3](#).

1.2 Home Automation Benefits

Home automation brings a variety of benefits, depending on the application area(s). These potential benefits include:

- Easier lifestyle
- Convenience of flexible control and remote control
- Increased safety around the home
- Improved security of the home
- Energy savings with associated cost savings and environmental benefits

The energy saving features of home automation are outlined in [Section 1.4](#).

1.3 Home Automation Application Areas

Home automation solutions can be applied to many aspects of the home, as described in the sub-sections below.

Note: Not all of the application areas described below are currently supported by the ZigBee Home Automation (HA) profile from NXP.

1.3.1 Lighting

Lighting systems can be implemented with the following functionality:

- Control lights from various points, including wall-switches, occupancy sensors, remote control units, smartphones, tablets and computers
- Control lights in terms of brightness and colour (for colour lamps)
- Control a pre-defined group of lights by a single action
- Definition of brightness and/or colour settings for one or more lights, forming a 'scene' for mood lighting

Lighting solutions are supported by NXP's ZigBee HA profile.

Note: For a pure lighting system (with no other HA application areas), the ZigBee Light Link (ZLL) profile provides an alternative to the Home Automation profile. For details of NXP's ZLL profile, refer to the *ZigBee Light Link User Guide (JN-UG-3091)*.

1.3.2 Heating, Ventilation and Air-Conditioning (HVAC)

HVAC systems can be implemented with the following functionality:

- Control heating and/or air-conditioning from various points, including wall-mounted control units, thermostats, occupancy sensors, remote control units, smartphones, tablets and computers
- Control the heating and/or air-conditioning in individual rooms according to their use and/or occupancy
- Control a pre-defined group of heaters or fans by a single action
- Definition of heating/cooling settings (e.g. temperatures) for one or more rooms, forming a 'scene'

HVAC solutions are not currently supported by NXP's ZigBee HA profile.

1.3.3 Shades and Window Coverings

The control of shades and window coverings (blinds and curtains) can be implemented with the following functionality:

- Control shades and window coverings from various points, including wall-mounted control units, remote control units, smartphones, tablets and computers
- Open/close shades and window coverings, including partial opening/closing
- Control a pre-defined group of shades or window coverings by a single action
- Definition of open/close settings for one or more shades or window coverings, forming a 'scene'

Shade and window covering solutions are not currently supported by NXP's ZigBee HA profile.

1.3.4 Security Systems

Security systems (intruder, fire, general emergency) can be implemented with the following functionality:

- Control the security system from various points, including wall-mounted control units, remote control units, smartphones, tablets and computer
- Control a pre-defined group of security sensors or door-locks by a single action
- Definition of security settings for one or more sensors or door-locks, forming a 'scene'

Note: The IAS (Intruder Alarm System) resources of the HA profile incorporate sensors that can trigger alarms. Door-locks are included under Generic resources.

1.4 Energy Saving

A ZigBee Home Automation system can result in energy saving and associated cost savings for a household. The following may be employed to achieve this:

- **Scenes and timers:** Energy savings can be achieved through the careful configuration of 'scenes' and timers to ensure that no more energy is consumed than is actually needed.
- **Occupancy sensors:** Infra-red or movement sensors can be used to switch on appliances, such as lights, only when a person is detected (and switch off when a person is no longer detected). As an example, this method may be very useful for controlling lights in a corridor or garage, or outside lights.
- **Energy monitoring:** The power consumption of an HA system may be monitored.

1.5 ZigBee Wireless Networks

ZigBee Home Automation (HA) is a public application profile that has been devised by the ZigBee Alliance to support home automation solutions based on the ZigBee PRO wireless network protocol. ZigBee PRO is fully described in the *ZigBee PRO Stack User Guide (JN-UG-3101)*.

A Mesh network topology is employed. Therefore, for maximum routing flexibility, all the network nodes of an HA system should be ZigBee Routers (although ZigBee End Devices are permitted, they cannot perform Mesh routing).

The manufacturer application that runs on an HA node provides the interface between the HA profile software and the hardware of the node (e.g. the physical switch mechanism of a lamp).

Note: The software architecture for HA, in terms of a protocol stack, is described in more detail in [Section 1.6](#).

The HA profile contains a number of 'devices', which are ZigBee software entities used to implement particular functionality on a node - for example, the 'On/Off Light' device is used to switch a lamp on and off. The set of devices used in a node determines the total functionality of the node.

Each HA device uses a number of clusters, where most clusters used in the HA profile come from the ZigBee Cluster Library (ZCL). Complete lists of the devices and associated clusters used by the HA profile are provided in [Chapter 2](#).

1.6 Software Architecture

The ZigBee Home Automation profile operates in conjunction with the ZigBee PRO wireless network protocol. The software stack which runs on each HA node is illustrated in [Figure 1](#) below.

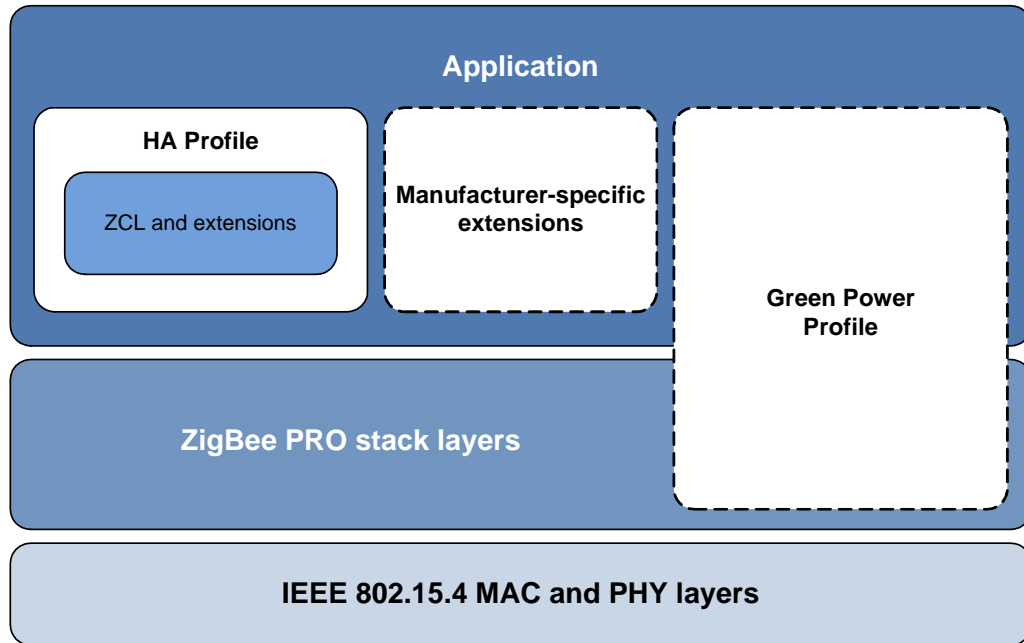

Figure 1: HA Software Stack

The main features of the above stack are as follows:

- Manufacturer application, which interfaces to the underlying ZigBee PRO stack layers and controls the appliance hardware of the node, and uses:
 - HA profile, including ZCL resources (ZCL clusters and extensions)
 - Optional manufacturer-specific extensions to the HA profile
 - Optional ZigBee Green Power profile, described in the *ZigBee Green Power User Guide (JN-UG-3095)*
- ZigBee PRO stack layers, as described in the *ZigBee PRO Stack User Guide (JN-UG-3101)*

1.7 Interoperability and Certification

ZigBee Home Automation provides a framework of interoperability between products from different manufacturers. This is formalised through an HA certification and compliance programme, in which completed products are tested for compliance to the HA profile and, if successful, are HA certified.

Thus, a product developed and certified to the HA profile will be able operate with other certified products in a HA system, irrespective of their manufacturers. This is an important feature for the consumer market.

In addition, the HA profile is designed to be interoperable at the network layer with other public ZigBee application profiles.

1.8 Commissioning

The process of introducing an HA device into an HA network is called commissioning. This involves finding an HA network, joining the network and ultimately binding an endpoint on the new device to a compatible endpoint on an existing device, in order to allow the new device to perform its function within the network (e.g. pairing a new light-switch with an existing lamp so that the switch can control the lamp).

The HA software solution from NXP supports EZ-mode Commissioning (defined in the Home Automation Specification 1.2). It is a ZigBee requirement that all HA devices support this mode of commissioning (except a 'Commissioning Director').

In EZ-mode Commissioning, an HA device is commissioned by means of user interactions, such as button-presses. This commissioning mode does allow some automatic behaviour, such as automatically joining a network at power-up, but some user intervention will always be required to complete the commissioning process.

EZ-mode Commissioning resources are provided in certain NXP HA Application Notes and are described in the *ZigBee Cluster Library User Guide (JN-UG-3103)*.

Note: ZigBee specify the commissioning terminology that should be used by all HA product documentation in order to ensure consistency between products and manufacturers. This recommended terminology is also detailed in the *ZCL User Guide (JN-UG-3103)*.

1.9 Internet Connectivity

ZigBee Home Automation offers the possibility of controlling the appliances in an HA system via the Internet. Thus, this control can be performed from any Internet-connected device (PC, tablet, smartphone) located anywhere in the World (e.g. while on holiday in another country).

Access from the Internet requires the HA system to include an IP router or gateway (connected to the Internet) as one of the network nodes. A gateway solution is described in the Application Note *ZigBee Gateway (JN-AN-1194)*, available from NXP.

In addition to the real-time control of an HA system over the Internet, the system could also be configured from a device on the Internet (e.g. groups, scenes and timers).

2. Home Automation (HA) Profile

Home Automation (HA) is ZigBee application profile 0x0104. This chapter details the ZigBee devices available in the HA profile and the clusters that they use.

Note: This manual assumes that you are already familiar with ZigBee PRO concepts such as endpoints, profiles, clusters and attributes. For more information, refer to the *ZigBee PRO Stack User Guide (JN-UG-3101)*.

2.1 HA Devices

This manual covers the following devices from the ZigBee Home Automation application profile, which are divided into application-oriented categories:

- **Generic Devices** (described in [Section 2.3](#))
 - On/Off Switch
 - On/Off Output
 - Remote Control
 - Door Lock
 - Door Lock Controller
 - Simple Sensor
 - Smart Plug
- **Lighting Devices** (described in [Section 2.4](#))
 - On/Off Light
 - Dimmable Light
 - Colour Dimmable Light
 - On/Off Light Switch
 - Dimmer Switch
 - Colour Dimmer Switch
 - Light Sensor
 - Occupancy Sensor
- **HVAC Devices** (described in [Section 2.5](#))
 - Thermostat

- **Intruder Alarm System (IAS) Devices** (described in [Section 2.5](#))
 - Control and Indicating Equipment (CIE)
 - Ancillary Control Equipment (ACE)
 - Zone
 - Warning Device (WD)

The HA profile contains many other devices that are not currently implemented in the NXP HA software - for the full list of HA devices, refer to the *ZigBee Home Automation Profile Specification (053520)*, available from the ZigBee Alliance (www.zigbee.org).

2.2 Common Clusters

The HA devices are defined by the clusters that they use. Some clusters are common to most HA devices - these are detailed in the table below.

Note: For each device, there are mandatory clusters and optional clusters. Also, the clusters are different for the server (input) and client (output) sides of the device.

Server (Input) Side	Client (Output) Side
Mandatory	
Basic	
Identify	
Optional	
Clusters with reporting capability	Clusters with reporting capability
Power Configuration	Time
Device Temperature Configuration	OTA Bootload
Alarms	Partition
Electrical Measurement	
Poll Control	
Partition	
Manufacturer-specific	Manufacturer-specific

Table 1: Common Clusters for HA Devices

2.3 Generic Devices

This section details the HA Generic Devices, including the clusters that they support. The Generic Devices are listed in the table below along with their Device IDs and references to the sub-sections in which they are described.

Generic Device	Device ID	Reference
On/Off Switch	0x0000	Section 2.3.1
On/Off Output	0x0002	Section 2.3.2
Remote Control	0x0006	Section 2.3.3
Door Lock	0x000A	Section 2.3.4
Door Lock Controller	0x000B	Section 2.3.5
Simple Sensor	0x000C	Section 2.3.6
Smart Plug	0x0051	Section 2.3.7

Table 2: Generic Devices

Note 1: The clusters used by these devices are mostly contained in the ZigBee Cluster Library and are described in the *ZCL User Guide (JN-UG-3103)*. However, not all the listed clusters are currently supported by the NXP software.

Note 2: The Smart Plug device uses some clusters that are described in the *ZigBee Smart Energy User Guide (JN-UG-3059)*.

2.3.1 On/Off Switch

The On/Off Switch device is used to switch another device on and off by sending on, off and toggle commands to the target device.

Note: This device should be used only when a more specific device profile is not available - for example, the On/Off Light Switch device should be used to control the On/Off Light device.

- The Device ID is 0x0000
- The header file for the device is **on_off_switch.h**
- The device structure, `tsHA_OnOffSwitchDevice`, is listed in [Section 14.1.1](#)
- The endpoint registration function for the device, **eHA_RegisterOnOffSwitchEndPoint()**, is detailed in [Chapter 13](#)

The clusters used by the On/Off Switch device are listed in the table below.

Server (Input) Side	Client (Output) Side
Mandatory	
Basic	On/Off (subject to binding)
Identify	Identify
Optional	
See Table 1 on page 26	See Table 1 on page 26
On/Off Switch Configuration	Scenes
	Groups

Table 3: Clusters for On/Off Switch

2.3.2 On/Off Output

The On/Off Output device is capable of being switched on and off.

Note: This device should be used only when a more specific device profile is not available - for example, the On/Off Light device.

- The Device ID is 0x0002
- The header file for the device is **on_off_output.h**
- The device structure, `tsHA_OnOffOutputDevice`, is listed in [Section 14.1.2](#)
- The endpoint registration function for the device, **eHA_RegisterOnOffOutputEndPoint()**, is detailed in [Chapter 13](#)

The clusters used by the On/Off Output device are listed in the table below.

Server (Input) Side	Client (Output) Side
Mandatory	
Basic	
Identify	
On/Off	
Scenes	
Groups	
Optional	
See Table 1 on page 26	See Table 1 on page 26

Table 4: Clusters for On/Off Output

2.3.3 Remote Control

The Remote Control device is used to control and monitor one or more other devices. The client side is typically incorporated in a handheld unit, with the server side in the node(s) to be controlled/monitored.

- The Device ID is 0x0006
- The header file for the device is **remote_control.h**
- The device structure, `tsHA_RemoteControlDevice`, is listed in [Section 14.1.3](#)
- The endpoint registration function for the device, **eHA_RegisterRemoteControlEndPoint()**, is detailed in [Chapter 13](#)

The clusters used by the Remote Control device are listed in the table below.

Server (Input) Side	Client (Output) Side
Mandatory	
Basic	At least one optional cluster
Identify	
Optional	
See Table 1 on page 26	See Table 1 on page 26
	Basic
	Identify
	On/Off
	Level Control
	Groups
	Scenes
	Colour Control
	Pump Configuration and Control
	Shade Configuration
	On/Off Switch Configuration
	Temperature Measurement
	Illuminance Level Sensing
	Illuminance Measurement
	Window Covering
	Door Lock
	Thermostat

Table 5: Clusters for Remote Control

2.3.4 Door Lock

The Door Lock device is able to receive commands from a Door Lock Controller device (see [Section 2.3.5](#)).

- The Device ID is 0x000A
- The header file for the device is **door_lock.h**
- The device structure, `tsHA_DoorLockDevice`, is listed in [Section 14.1.4](#)
- The endpoint registration function for the device, **eHA_RegisterDoorLockEndPoint()**, is detailed in [Chapter 13](#)

The clusters used by the Door Lock device are listed in the table below.

Server (Input) Side	Client (Output) Side
Mandatory	
Basic	
Identify	
Door Lock	
Scenes	
Groups	
Optional	
See Table 1 on page 26	See Table 1 on page 26
Alarms	Time
Power Configuration	OTA Bootload
Poll Control	

Table 6: Clusters for Door Lock

Note: In Home Automation, the Door Lock cluster is enhanced to allow Application-level security to be used (in addition to the default Network-level security). For details, refer to the *ZCL User Guide (JN-UG-3103)*.

2.3.5 Door Lock Controller

The Door Lock Controller device is able to send commands to a Door Lock device (see [Section 2.3.4](#)).

- The Device ID is 0x000B
- The header file for the device is **door_lock_controller.h**
- The device structure, `tsHA_DoorLockControllerDevice`, is listed in [Section 14.1.5](#)
- The endpoint registration function for the device, **eHA_RegisterDoorLockControllerEndPoint()**, is detailed in [Chapter 13](#)

The clusters used by the Door Lock Controller device are listed in the table below.

Server (Input) Side	Client (Output) Side
Mandatory	
Basic	Door Lock
Identify	Scenes
	Group
	Identify
Optional	
See Table 1 on page 26	See Table 1 on page 26

Table 7: Clusters for Door Lock Controller

Note: In Home Automation, the Door Lock cluster is enhanced to allow Application-level security to be used (in addition to the default Network-level security). For details, refer to the *ZCL User Guide (JN-UG-3103)*.

2.3.6 Simple Sensor

The Simple Sensor device is able to accept a binary input from an on/off device such as magnetic window contacts.

- The Device ID is 0x000C
- The header file for the device is **simple_sensor.h**
- The device structure, `tsHA_SimpleSensorDevice`, is listed in [Section 14.1.6](#)
- The endpoint registration function for the device, **eHA_RegisterSimpleSensorEndPoint()**, is detailed in [Chapter 13](#)

The clusters used by the Simple Sensor device are listed in the table below.

Server (Input) Side	Client (Output) Side
Mandatory	
Basic	Identify
Identify	
Binary Input (Basic)	
Optional	
See Table 1 on page 26	See Table 1 on page 26

Table 8: Clusters for Simple Sensor

2.3.7 Smart Plug

The Smart Plug device can be used in both monitoring and control activities. It can provide data on the instantaneous power consumption of the attached appliance by means of the Simple Metering cluster. It can also be controlled using the On/Off cluster.

- The Device ID is 0x0051
- The header file for the device is **smart_plug.h**
- The device structure, `tsHA_SmartPlugDevice`, is listed in [Section 14.1.7](#)
- The endpoint registration function for the device, **eHA_RegisterSmartPlugEndPoint()**, is detailed in [Chapter 13](#)

The clusters used by the Smart Plug device are listed in the table below.

Server (Input) Side	Client (Output) Side
Mandatory	
Basic	Identify
Simple Metering *	
On/Off	
Optional	
See Table 1 on page 26	See Table 1 on page 26
Electrical Measurement	Time
	Demand-Response and Load Control *
	Price *

Table 9: Clusters for Smart Plug

* These clusters are described in the *ZigBee Smart Energy User Guide (JN-UG-3059)*

2.4 Lighting Devices

This section details the Lighting Devices, including the clusters that they support. The Lighting Devices are listed in the table below along with their Device IDs and references to the sub-sections in which they are described.

Lighting Device	Device ID	Reference
On/Off Light	0x0100	Section 2.4.1
Dimmable Light	0x0101	Section 2.4.2
Colour Dimmable Light	0x0102	Section 2.4.3
On/Off Light Switch	0x0103	Section 2.4.4
Dimmer Switch	0x0104	Section 2.4.5
Colour Dimmer Switch	0x0105	Section 2.4.6
Light Sensor	0x0106	Section 2.4.7
Occupancy Sensor	0x0107	Section 2.4.8

Table 10: Lighting Devices

The possible pairings of these devices are summarised in the table below:

Controller Device	Controlled Device	Description
On/Off Light Switch	On/Off Light	Switch or sensor puts light in one of two states, on or off
Light Sensor		
Occupancy Sensor		
Dimmer Switch	Dimmable Light	Switch or sensor controls luminance of light between maximum and minimum levels, or puts light in on or off state
Light Sensor		
Occupancy Sensor		
Colour Dimmer Switch	Colour Dimmable Light	Switch or sensor controls hue, saturation and luminance of multi-colour light, or puts light in on or off state
Light Sensor		
Occupancy Sensor		

Table 11: Pairings of Lighting Devices

Note: The clusters used by these devices are contained in the ZigBee Cluster Library and are described in the *ZCL User Guide (JN-UG-3103)*. However, not all the listed clusters are currently supported by the NXP software.

2.4.1 On/Off Light

The On/Off Light device is simply a light that can be switched on and off (two states only and no intermediate levels).

- The Device ID is 0x0100
- The header file for the device is **on_off_light.h**
- The device structure, `tsHA_OnOffLightDevice`, is listed in [Section 14.2.1](#)
- The endpoint registration function for the device, **eHA_RegisterOnOffLightEndPoint()**, is detailed in [Chapter 13](#)

The clusters used by the On/Off Light device are listed in the table below.

Server (Input) Side	Client (Output) Side
Mandatory	
Basic	
Identify	
On/Off	
Scenes	
Groups	
Optional	
See Table 1 on page 26	See Table 1 on page 26
	Occupancy Sensing

Table 12: Clusters for On/Off Light

2.4.2 Dimmable Light

The Dimmable Light device is a light that can have its luminance varied, and can be switched on and off.

- The Device ID is 0x0101
- The header file for the device is **dimmable_light.h**
- The device structure, `tsHA_DimmableLightDevice`, is listed in [Section 2.4.2](#)
- The endpoint registration function for the device, **eHA_RegisterDimmableLightEndPoint()**, is detailed in [Chapter 13](#)

The clusters used by the Dimmable Light device are listed in the table below.

Server (Input) Side	Client (Output) Side
Mandatory	
Basic	
Identify	
On/Off	
Level Control	
Scenes	
Groups	
Optional	
See Table 1 on page 26	See Table 1 on page 26
	Occupancy Sensing

Table 13: Clusters for Dimmable Light

2.4.3 Colour Dimmable Light

The Colour Dimmable Light device is a multi-colour light that can have its hue, saturation and luminance varied, and can be switched on and off.

- The Device ID is 0x0102
- The header file for the device is **colour_dimmable_light.h**
- The device structure, `tsHA_ColourDimmableLightDevice`, is listed in [Section 2.4.3](#)
- The endpoint registration function for the device, **eHA_RegisterColourDimmableLightEndPoint()**, is detailed in [Chapter 13](#)

The clusters used by the Colour Dimmable Light device are listed in the table below.

Server (Input) Side	Client (Output) Side
Mandatory	
Basic	
Identify	
On/Off	
Level Control	
Colour Control	
Scenes	
Groups	
Optional	
See Table 1 on page 26	See Table 1 on page 26
	Occupancy Sensing

Table 14: Clusters for Colour Dimmable Light

2.4.4 On/Off Light Switch

The On/Off Light Switch device is used to switch a light device on and off by sending on, off and toggle commands to the target device.

- The Device ID is 0x0103
- The header file for the device is **on_off_light_switch.h**
- The device structure, `tsHA_OnOffLightSwitchDevice`, is listed in [Section 14.2.4](#)
- The endpoint registration function for the device, **eHA_RegisterOnOffLightSwitchEndPoint()**, is detailed in [Chapter 13](#)

The clusters used by the On/Off Light Switch device are listed in the table below.

Server (Input) Side	Client (Output) Side
Mandatory	
Basic	On/Off
Identify	Identify
Optional	
See Table 1 on page 26	See Table 1 on page 26
On/Off Switch Configuration	Scenes
	Groups

Table 15: Clusters for On/Off Light Switch

Note: The On/Off Light Switch supports the same clusters as the On/Off Switch (see [Section 2.3.1](#)) and has the same functionality.

2.4.5 Dimmer Switch

The Dimmer Switch device is used to control a characteristic of a light (e.g. luminance) and to switch the light device on and off.

- The Device ID is 0x0104
- The header file for the device is **dimmer_switch.h**
- The device structure, `tsHA_DimmerSwitchDevice`, is listed in [Section 14.2.5](#)
- The endpoint registration function for the device, **eHA_RegisterDimmerSwitchEndPoint()**, is detailed in [Chapter 13](#)

The clusters used by the Dimmer Switch device are listed in the table below.

Server (Input) Side	Client (Output) Side
Mandatory	
Basic	On/Off
Identify	Identify
	Level Control
Optional	
See Table 1 on page 26	See Table 1 on page 26
On/Off Switch Configuration	Scenes
	Groups

Table 16: Clusters for Dimmer Switch

Note: The Dimmer Switch supports the same clusters as the Level Control Switch (see [Section 2.3.2](#)) and has the same functionality.

2.4.6 Colour Dimmer Switch

The Colour Dimmer Switch device is used to control the hue, saturation and luminance of a multi-colour light, and to switch the light device on and off.

- The Device ID is 0x0105
- The header file for the device is **colour_dimmer_switch.h**
- The device structure, `tsHA_ColourDimmerSwitchDevice`, is listed in [Section 14.2.6](#)
- The endpoint registration function for the device, **eHA_RegisterColourDimmerSwitchEndPoint()**, is detailed in [Chapter 13](#)

The clusters used by the Colour Dimmer Switch device are listed in the table below.

Server (Input) Side	Client (Output) Side
Mandatory	
Basic	On/Off
Identify	Level Control
	Colour Control
	Identify
Optional	
See Table 1 on page 26	See Table 1 on page 26
On/Off Switch Configuration	Scenes

Table 17: Clusters for Colour Dimmer Switch

2.4.7 Light Sensor

The Light Sensor device reports the illumination level in an area.

- The Device ID is 0x0106
- The header file for the device is **light_sensor.h**
- The device structure, `tsHA_LightSensorDevice`, is listed in [Section 14.2.7](#)
- The endpoint registration function for the device, **eHA_RegisterLightSensorEndPoint()**, is detailed in [Chapter 13](#)

The clusters used by the Light Sensor device are listed in the table below.

Server (Input) Side	Client (Output) Side
Mandatory	
Basic	Identify
Identify	
Illuminance Measurement	
Optional

	Groups

Table 18: Clusters for Light Sensor

2.4.8 Occupancy Sensor

The Occupancy Sensor device reports the presence (or not) of occupants in an area.

- The Device ID is 0x0107
- The header file for the device is **occupancy_sensor.h**
- The device structure, `tsHA_OccupancySensorDevice`, is listed in [Section 2.4.8](#)
- The endpoint registration function for the device, **eHA_RegisterOccupancySensorEndPoint()**, is detailed in [Chapter 13](#)

The clusters used by the Occupancy Sensor device are listed in the table below.

Server (Input) Side	Client (Output) Side
Mandatory	
Basic	Identify
Identify	
Occupancy Sensing	
Optional

Table 19: Clusters for Occupancy Sensor

2.5 HVAC Devices

This section details the HVAC (Heating, Ventilation and Air-Conditioning) Devices, including the clusters that they support. The HVAC Devices are listed in the table below along with their Device IDs and references to the sub-sections in which they are described (currently, only one HVAC Device is supported).

HVAC Device	Device ID	Reference
Thermostat	0x0301	Section 2.5.1

Table 20: HVAC Devices

2.5.1 Thermostat

The Thermostat device allows temperature to be controlled either locally or remotely. It may take temperature, humidity and occupancy inputs from sensors that either are integrated into the physical device or are separate entities. The device may send temperature requirements to a remote heating/cooling unit or incorporate a mechanism to directly control a local heating/cooling unit.

- The Device ID is 0x0301
- The header file for the device is **thermostat_device.h**
- The device structure, `tsHA_ThermostatDevice`, is listed in [Section 14.3.1](#)
- The endpoint registration function for the device, **eHA_RegisterThermostatEndPoint()**, is detailed in [Chapter 13](#)

Server (Input) Side	Client (Output) Side
Mandatory	
Basic	
Thermostat	
Optional	
See Table 1 on page 26	See Table 1 on page 26
Scenes	Fan Control
Groups	Temperature Measurement
Thermostat User Interface Configuration	Occupancy Sensing
Fan Control	Relative Humidity Temperature
Temperature Measurement	Time
Occupancy Sensing	OTA Bootload
Relative Humidity Temperature	
Alarms

2.6 Intruder Alarm System (IAS) Devices

This section details the Intruder Alarm System (IAS) Devices, including the clusters that they support. The IAS Devices are listed in the table below along with their Device IDs and references to the sub-sections in which they are described.

IAS Device	Device ID	Reference
IAS Control and Indicating Equipment (CIE)	0x0400	Section 2.6.1
IAS Ancillary Control Equipment (ACE)	0x0401	Section 2.6.2
IAS Zone	0x0402	Section 2.6.3
IAS Warning Device (WD)	0x0403	Section 2.6.4

Table 22: IAS Devices

The relationships between these devices in an IAS are illustrated in the figure below.

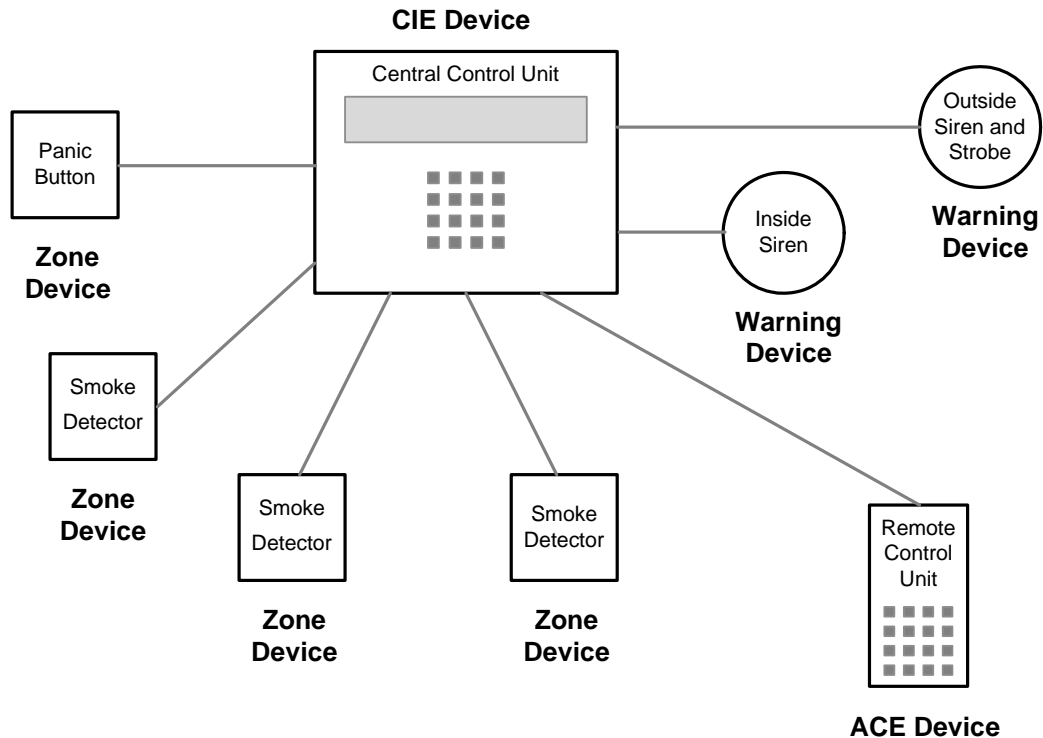

Figure 1: Example of Devices in an IAS

Note: The Intruder Alarm System (IAS) Devices are not exclusively concerned with intruders but also cover other emergencies, such as fire, as depicted in the above example system.

Note 1: The clusters used by the IAS devices are contained in the ZigBee Cluster Library and are described in the *ZCL User Guide (JN-UG-3103)*.

Note 2: For an example system that uses the IAS devices and clusters, refer to the Application Note *ZigBee Intruder Alarm System (JN-AN-1201)*.

2.6.1 IAS Control and Indicating Equipment (CIE)

The Control and Indicating Equipment (CIE) device provides the functionality for the central control node of an IAS. As such, this device communicates with all the other IAS devices (ACE, Zone and WD).

- The Device ID is 0x0400
- The header file for the device is **control_and_indicating_equipment.h**
- The device structure, `tSHA_IASCIE`, is listed in [Section 14.4.1](#)
- The endpoint registration function for the device, **eHA_RegisterIASCIEEndPoint()**, is detailed in [Chapter 13](#)

The clusters used by the CIE device are listed in the table below.

Server (Input) Side	Client (Output) Side
Mandatory	
Basic	IAS WD
Identify	Identify
IAS ACE	IAS Zone
Optional	
See Table 1 on page 26	See Table 1 on page 26
	Scenes
	Group

Table 23: Clusters for CIE Device

2.6.2 IAS Ancillary Control Equipment (ACE)

The Ancillary Control Equipment (ACE) device provides the functionality for a remote control node for an IAS. This device communicates with the CIE device on the central control node of the IAS.

- The Device ID is 0x0401
- The header file for the device is **ancillary_control_equipment.h**
- The device structure, `t_sHA_IASACE`, is listed in [Section 14.4.2](#)
- The endpoint registration function for the device, **eHA_RegisterIASACEEndPoint()**, is detailed in [Chapter 13](#)

The clusters used by the ACE device are listed in the table below.

Server (Input) Side	Client (Output) Side
Mandatory	
Basic	IAS ACE
Identify	Identify
IAS Zone	
Optional	
See Table 1 on page 26	See Table 1 on page 26

Table 24: Clusters for ACE Device

2.6.3 IAS Zone

The Zone device provides the functionality for a sensor node (e.g. fire/smoke sensor) for an IAS. It supports up to two alarm types (Alarm1 and Alarm2) and low-battery reports. This device communicates with the CIE device on the central control node of the IAS.

- The Device ID is 0x0401
- The header file for the device is **zone.h**
- The device structure, `tsHA_IASZoneDevice`, is listed in [Section 14.4.3](#)
- The endpoint registration function for the device, **eHA_RegisterIASZoneEndPoint()**, is detailed in [Chapter 13](#)

The clusters used by the Zone device are listed in the table below.

Server (Input) Side	Client (Output) Side
Mandatory	
Basic	
Identify	
IAS Zone	
Optional	
See Table 1 on page 26	See Table 1 on page 26

Table 25: Clusters for Zone Device

2.6.4 IAS Warning Device (WD)

The Warning Device (WD) provides the functionality for issuing audible and visible warning signals in an IAS. The device receives instructions from the CIE device on the central control node to activate these warnings.

- The Device ID is 0x0403
- The header file for the device is **warning_device.h**
- The device structure, `tsHA_IASWarningDevice`, is listed in [Section 14.4.4](#)
- The endpoint registration function for the device, **eHA_RegisterIASWarningDeviceEndPoint()**, is detailed in [Chapter 13](#)

The clusters used by the Warning Device are listed in the table below.

Server (Input) Side	Client (Output) Side
Mandatory	
Basic	
Identify	
IAS WD	
IAS Zone	
Optional	
See Table 1 on page 26	See Table 1 on page 26

Table 26: Clusters for Warning Device

3. HA Application Development

This chapter provides basic guidance on developing a ZigBee Home Automation (HA) application. The topics covered in this chapter include:

- Development resources and their installation ([Section 3.1](#))
- HA programming resources ([Section 3.2](#))
- API functions ([Section 3.3](#))
- Development phases ([Section 3.4](#))
- Building an application ([Section 3.5](#))

Application coding is described separately in [Chapter 4](#).

3.1 Development Resources and Installation

NXP provide a wide range of resources to aid in the development of ZigBee HA applications for the JN5168 and JN5169 wireless microcontrollers. An HA application is developed as a ZigBee PRO application that uses the NXP ZigBee PRO APIs in conjunction with JenOS (Jennic Operating System), together with HA-specific and ZCL resources. All resources are available from the Wireless Connectivity area of the NXP web site (see [“Support Resources” on page 15](#)) and are outlined below.

The resources for developing a ZigBee HA application are supplied free-of-charge in a Software Developer's Kit (SDK), which is provided as two installers:

- **HA/ZLL SDK (JN-SW-4168):** This installer is shared with ZigBee Light Link (ZLL) and contains the ZigBee PRO stack, the ZigBee HA profile software and the ZigBee Green Power (GP) profile software, including a number of C APIs:
 - HA, ZCL and GP APIs
 - ZigBee PRO APIs
 - JenOS APIs
 - JN516x Integrated Peripherals API

In addition, the ZPS and JenOS Configuration Editors are provided in this installer (these are plug-ins for 'BeyondStudio for NXP' - see below).

- **BeyondStudio for NXP (JN-SW-4141):** This installer contains the toolchain that you will use in creating an application, including:
 - 'Beyond Studio for NXP' IDE (Integrated Development Environment)
 - Integrated JN51xx compiler
 - Integrated JN516x Flash Programmer

For full details of the toolchain and installation instructions for the toolchain and SDK, refer to the *BeyondStudio for NXP Installation and User Guide (JN-UG-3098)*.

An HA demonstration application is provided in the Application Note *ZigBee Home Automation Demonstration (JN-AN-1189)*, available from the NXP web site.

3.2 HA Programming Resources

The NXP HA API contains a range of resources (such as functions and structures), including:

- Core resources (e.g. for initialising the API and registering device endpoints)
- Cluster-specific resources

These resources are introduced in the sub-sections below.

3.2.1 Core Resources

The core resources of the HA profile handle the basic operations required in an HA network, irrespective of the clusters used. Some of these resources are provided in the HA API and some are provided in the ZCL API.

- Functions for the following operations are provided in the HA API and are detailed in [Chapter 13](#):
 - Initialising the HA API (one function)
 - Servicing timing requirements (one function)
 - Registering a device endpoint on an HA node (one function per device)
- Functions for the following operations are provided in the ZCL API and are detailed in the *ZCL User Guide (JN-UG-3103)*:
 - Requesting a read access to cluster attributes on a remote device
 - Requesting a write access to cluster attributes on a remote device
 - Handling events on an HA device

Use of the above functions is described in [Chapter 4](#).

3.2.2 Cluster-specific Resources

An HA device uses certain mandatory and optional ZigBee clusters, as listed for each device in [Chapter 2](#).

Many of these clusters are taken from the ZCL and introduced in [Chapter 5](#). They are fully described in the *ZigBee Cluster Library User Guide (JN-UG-3103)*.

3.3 Function Prefixes

The API functions used in HA are categorised and prefixed in the following ways:

- **HA functions:** Used to interact with the HA profile and prefixed with **xHA_**
- **ZCL functions:** Used to interact with the ZCL and prefixed with **xZCL_**
- **Cluster functions:** Used to interact with clusters and prefixed as follows:
 - For clusters defined in the HA specification, they are prefixed with **xHA_**
 - For clusters defined in the ZCL specification, they are prefixed with **xCLD_**

In the above prefixes, x represents one or more characters that indicate the return type, e.g. “v” for **void**.

Only functions that are HA-specific are detailed in this manual. Functions which relate to clusters of the ZCL are detailed in the *ZCL User Guide (JN-UG-3103)*.

3.4 Development Phases

The main phases of development for an HA application are the same as for any ZigBee PRO application, and are outlined below.

Note: Before starting your HA application development, you should familiarise yourself with the general aspects of ZigBee PRO application development, described in the *ZigBee PRO Stack User Guide (JN-UG-3101)*.

1. **Network Configuration:** Configure the ZigBee network parameters for the nodes using the ZPS Configuration Editor - refer to the *ZigBee PRO Stack User Guide (JN-UG-3101)*. 
2. **OS Configuration:** Configure the JenOS resources to be used by your application using the JenOS Configuration Editor - refer to the *JenOS User Guide (JN-UG-3075)*.
3. **Application Code Development:** Develop the application code for your nodes using the ZigBee PRO APIs, JenOS APIs, HA API and ZCL - refer to the *ZigBee PRO Stack User Guide (JN-UG-3101)*, *JenOS User Guide (JN-UG-3075)* and *ZCL User Guide (JN-UG-3103)*, as well as this manual.
4. **Application Build:** Build the application binaries for your nodes using the JN51xx compiler and linker built into BeyondStudio for NXP - refer to [Section 3.5](#) and to the *BeyondStudio for NXP Installation and User Guide (JN-UG-3098)*.
5. **Node Programming:** Load the application binaries into Flash memory on your nodes using the JN516x Flash programmer built into BeyondStudio for NXP - refer to the *BeyondStudio for NXP Installation and User Guide (JN-UG-3098)*.

3.5 Building an Application

This section outlines how to build an HA application developed for the JN516x device. First of all, the configuration of compile-time options and ZigBee network parameters is described, and then directions are given for building and loading the application.

3.5.1 Compile-Time Options

Before the application can be built, the HA compile-time options must be configured in the header file **zcl_options.h** for the application. This header file is supplied in the Application Note *ZigBee Home Automation Demonstration (JN-AN-1189)*, which can be used as a template.

Number of Endpoints

The highest numbered endpoint used by the HA application must be specified - for example:

```
#define HA_NUMBER_OF_ENDPOINTS    3
```

Normally, the endpoints starting at endpoint 1 will be used for HA, so in the above case endpoints 1 to 3 will be used for HA. It is possible, however, to use the lower numbered endpoints for non-HA purposes, e.g. to run other protocols on endpoints 1 and 2, and HA on endpoint 3. In this case, with **HA_NUMBER_OF_ENDPOINTS** set to 3, some storage will be statically allocated by HA for endpoints 1 and 2 but never used. Note that this define applies only to local endpoints - the application can refer to remote endpoints with numbers beyond the locally defined value of **HA_NUMBER_OF_ENDPOINTS**.

Manufacturer Code

The ZCL allows a manufacturer code to be defined for devices developed by a certain manufacturer. This is a 16-bit value allocated to a manufacturer by the ZigBee Alliance and is set as follows:

```
#define ZCL_MANUFACTURER_CODE    0x1037
```

The above example sets the manufacturer code to the default value of 0x1037 (which belongs to NXP) but manufacturers should set their own allocated value.

Enabled Clusters

All required clusters must be enabled in the options header file. For example, an application for an On/Off Light device that uses all the possible clusters will require the following definitions:

```
#define CLD_BASIC
#define CLD_IDENTIFY
#define CLD_GROUPS
#define CLD_SCENES
#define CLD_ONOFF
```

Server and Client Options

Many clusters used in HA have options that indicate whether the cluster will act as a server or a client on the local device. If the cluster has been enabled using one of the above definitions, the server/client status of the cluster must be defined. For example, to employ the Groups cluster as a server, include the following definition in the header file:

```
#define GROUPS_SERVER
```

Support for Attribute Read/Write

Read/write access to cluster attributes must be explicitly compiled into the application, and must be enabled separately for the server and client sides of a cluster using the following macros in the options header file:

```
#define ZCL_ATTRIBUTE_READ_SERVER_SUPPORTED
#define ZCL_ATTRIBUTE_READ_CLIENT_SUPPORTED
#define ZCL_ATTRIBUTE_WRITE_SERVER_SUPPORTED
#define ZCL_ATTRIBUTE_WRITE_CLIENT_SUPPORTED
```

Note that each of the above definitions will apply to all clusters used in the application.

Optional Attributes

Many clusters have optional attributes that may be enabled at compile-time via the options header file - for example, the Basic cluster 'application version' attribute is enabled as follows:

```
#define CLD_BAS_ATTR_APPLICATION_VERSION
```

Note: Cluster-specific compile-time options are detailed in the chapters for the individual clusters in [Part II: HA Clusters](#). For clusters from the ZCL, refer to the *ZCL User Guide (JN-UG-3103)*.

3.5.2 ZigBee Network Parameters

HA applications may require specific settings of certain ZigBee network parameters. These parameters are set using the ZPS Configuration Editor. The full set of ZigBee network parameters are detailed in the *ZigBee PRO Stack User Guide (JN-UG-3101)*.

3.5.3 Building and Loading the Application Binary

An HA application for the JN516x device is built within BeyondStudio for NXP. For instructions on building an application, refer to the *BeyondStudio for NXP Installation and User Guide (JN-UG-3098)*. This guide also indicates how to load the built application binary file into a JN516x device using the integrated JN516x Flash programmer.

4. HA Application Coding

This chapter covers general aspects of HA application coding, including essential HA programming concepts, code initialisation, callback functions, reading and writing attributes, and event handling. Application coding that is particular to individual clusters is described later, in the relevant cluster-specific chapter.

Note: ZCL API functions referenced in this chapter are fully described in the *ZCL User Guide (JN-UG-3103)*.

4.1 HA Programming Concepts

This section describes the essential programming concepts that are needed in HA application development. The basic operations in a HA network are concerned with reading and setting the attribute values of the clusters of a device.

4.1.1 Shared Device Structures

In each HA device, attribute values are exchanged between the application and the HA library by means of a shared structure. This structure is protected by a mutex (described in the *ZCL User Guide (JN-UG-3103)*). The structure for a particular HA device contains structures for the clusters supported by that device (see [Chapter 2](#)). The available device structures are provided in [Chapter 14](#).

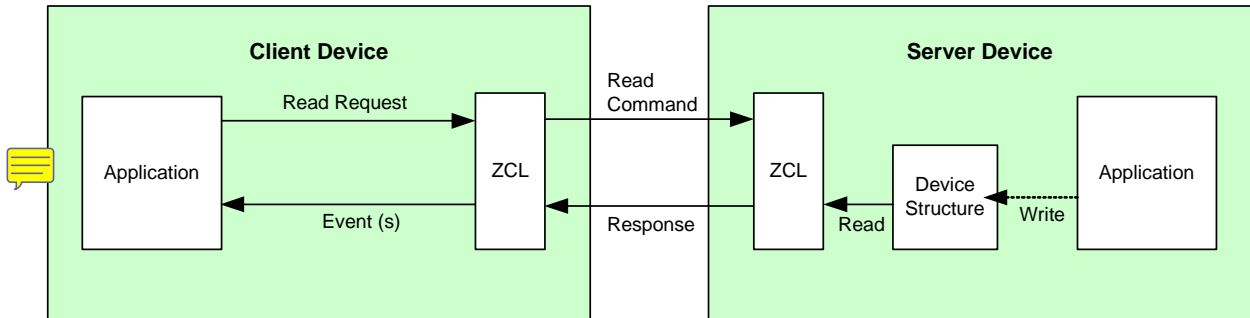

Note: In order to use a cluster which is supported by a device, the relevant option for the cluster must be specified at build-time - see [Section 3.5.3](#).

A shared device structure may be used in either of the following ways:

- The local application writes attribute values to the structure, allowing the ZigBee Cluster Library (ZCL) to respond to commands relating to these attributes.
- The ZCL parses incoming commands that write attribute values to the structure. The written values can then be read by the local application.

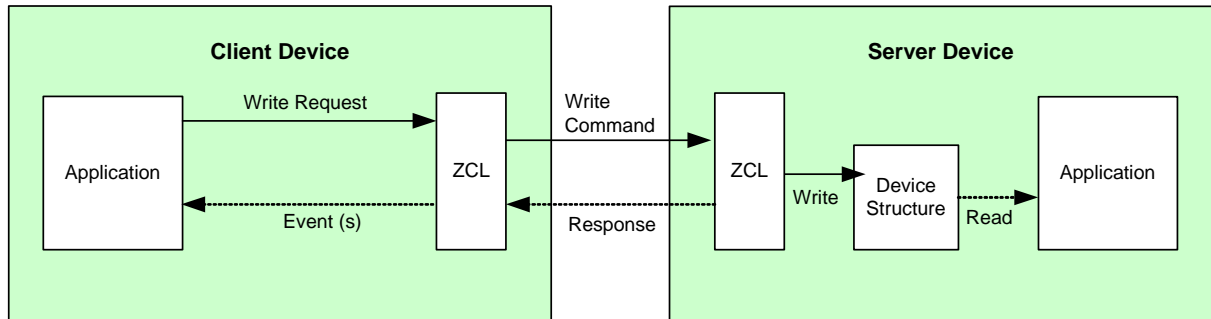

Remote read and write operations involving a shared device structure are illustrated in [Figure 2](#) below. For more detailed descriptions of these operations, refer to [Section 4.5](#) and [Section 4.6](#).

Reading Remote Attributes

1. Application requests read of attribute values from device structure on remote server and ZCL sends request.
2. If necessary, application first updates attribute values in device structure.
3. ZCL reads requested attribute values from device structure and then returns them to requesting client.
4. ZCL receives response and generates events (which can prompt application to read attributes from structure).

Writing Remote Attributes

1. ZCL sends 'write attributes' request to remote server.
2. ZCL writes received attribute values to device structure and optionally sends response to client.
3. If required, application can then read new attribute values from device structure.
4. ZCL can optionally generate a 'write attributes' response.
5. ZCL can receive optional response and generate events for the application (that indicate any unsuccessful writes).

Figure 2: Operations using Shared Device Structure

Note: Provided that there are no remote attribute writes, the attributes of a cluster server (in the shared structure) on a device are maintained by the local application(s).

4.1.2 Addressing

Communications between devices in an HA network are performed using standard ZigBee PRO mechanisms. A brief summary is provided below.

In order to perform an operation (e.g. a read) on a remote node in a ZigBee PRO network, a command must be sent from the relevant output (or client) cluster on the local node to the relevant input (or server) cluster on the remote node.

At a higher level, an application (and therefore the HA device and supported clusters) is associated with a unique endpoint, which acts as the I/O port for the application on the node. Therefore, a command is sent from an endpoint on the local node to the relevant endpoint(s) on the remote node.

The destination node(s) and endpoint(s) must be identified by the sending application. The endpoints on each node are numbered from 1 to 240. The target node(s) can be addressed in a number of different ways, listed below.

- 64-bit IEEE/MAC address
- 16-bit ZigBee network (short) address
- 16-bit group address, relating to a pre-specified group of nodes and endpoints
- A binding, where the source endpoint has been pre-bound to the remote node(s) and endpoint(s)
- A broadcast, in which the message is sent to all nodes of a certain type, one of:
 - all nodes in the network
 - all Routers and the Co-ordinator
 - all nodes for which 'receiver on when idle' - these include the Co-ordinator, Routers and non-sleeping End Devices

A destination address structure, `tsZCL_Address`, is defined in the ZCL and is detailed in the *ZCL User Guide (JN-UG-3103)*. Enumerations are provided for the addressing mode and broadcast mode in this structure, and are also detailed in the above manual.

4.1.3 OS Resources

The HA library and ZCL require OS resources, such as tasks and mutexes. These resources are provided by JenOS (Jennic Operating System), supplied in the SDK.

The JenOS resources for an application are allocated using the JenOS Configuration Editor, which is provided as an NXP-specific plug-in for the Eclipse IDE (and therefore BeyondStudio for NXP). Use of the JenOS Configuration Editor for an HA application should be based on the HA demonstration application (rather than on the standard ZigBee PRO stack template) to ensure that the extra JenOS resources required by the HA profile and the ZCL are available.

A JenOS mutex protects the shared structure that holds the cluster attribute values for a device (see [Section 4.1.1](#) above). The ZCL invokes an application callback function to lock and unlock this mutex. The mutex should be used in conjunction with the counting mutex code provided in the appendix of the *ZCL User Guide (JN-UG-3103)*.

The software for this mutex operation is contained in the HA demonstration application.

The task that the HA library and ZCL use to process incoming messages is defined in the HA demonstration application. Callbacks from the HA library and ZCL to the application will be in the context of this task. The HA demonstration application has a separate task for the user application code. This task also links to the shared-structure mutex in the JenOS configuration so that it can use critical sections to protect access to the shared structures.

Only data events addressed to the correct ZigBee profile, endpoint and cluster are processed by the ZCL, possibly with the aid of a callback function. Stack and data events that are not addressed to an HA endpoint are handled by the application through a callback function. All events are first passed into the ZCL using the function **vZCL_EventHandler()**. The ZCL either processes the event or passes it to the application, invoking the relevant callback function (refer to [Section 4.3](#) for information on callback functions and to [Section 4.7](#) for more details on event handling).

If the ZCL consumes a data event, it will free the corresponding Protocol Data Unit (PDU), otherwise it is the responsibility of the application to free the PDU.

4.2 Initialisation

An HA application is initialised like a normal ZigBee PRO application, as described in the section “Forming a Network” of the *ZigBee PRO Stack User Guide (JN-UG-3101)*, except there is no need to explicitly start the ZigBee PRO stack using the function **ZPS_eAplZdoStartStack()**. In addition, some HA initialisation must be performed in the application code.

Initialisation of an HA application must be performed in the following places and order:

1. In the header file **zcl_options.h**, enable the required compile-time options. These options include the clusters to be used by the device, the client/server status of each cluster and the optional attributes for each cluster. For more information on compile-time options, refer to [Section 3.5.1](#).

2. In the application, create an instance of the device structure by declaring a file scope variable - for example:

```
tsHA_DimmableLightDevice sDevice;
```

3. In the initialisation part of the application, set up the HA device(s) handled by your code, as follows:

- a) Set the initial values of the cluster attributes to be used by the device - for example:

```
sDevice.sBasicCluster.u8StackVersion = 1;  
sDevice.sBasicCluster....
```

These settings should appear in the code after JenOS has been started and before the HA initialisation function is called (next step).

- b) After calling **ZPS_eAplAflnit()**, call the HA initialisation function, **eHA_Initialise()**. This function requires you to specify a user-defined callback function for handling stack events (see [Section 4.3](#)), as well as a

pool of APDUs (Application Protocol Data Units) for sending and receiving data.

- c) Register each device by calling the relevant device registration function - for example, **eHA_RegisterDimmableLightEndPoint()**. In this function call, the device must be allocated a unique endpoint (in the range 1-240). In addition, its device structure must be specified as well as a user-defined callback function that will be invoked by the HA library when an event occurs relating to the endpoint (see [Section 4.3](#)). As soon as this function has been called, the shared device structure can be read by another device.

The device registration functions create instances of all the clusters used by the device, so there is no need to explicitly call the individual cluster creation functions, e.g. **eCLD_IdentifyCreateIdentify()** for the Identify cluster.

Note: The set of endpoint registration functions for the different HA device types are detailed in [Chapter 13](#).

4.3 Callback Functions

Two types of user-defined callback function must be provided (and registered as described in [Section 4.2](#)):

- **Endpoint Callback Function:** A callback function must be provided for each endpoint used, where this callback function will be invoked when an event occurs (such as an incoming message) relating to the endpoint. The callback function is registered with the HA library when the endpoint is registered using the registration function for the HA device type that the endpoint supports - for example, using **eHA_RegisterOnOffLightEndPoint()** for an On/Off Light device (see [Chapter 13](#)).
- **General Callback Function:** Events that do not have an associated endpoint are delivered via a callback function that is registered with the HA library through the function **eHA_Initialise()**. For example, stack leave and join events can be received by the application through this callback function.

The endpoint callback function and general callback function both have the type definition given below:

```
typedef void (* tfpZCL_ZCLCallbackFunction)
              (tsZCL_CallbackEvent *pCallbackEvent);
```

The callback events are detailed in the *ZCL User Guide (JN-UG-3103)* and event handling is further described in [Section 4.7](#).

4.4 Discovering Endpoints and Clusters

In order to communicate, a cluster client and cluster server must discover and store each other's contact details - that is, the address of the node and the number of the endpoint on which the relevant cluster resides.

The HA application on a node can discover other nodes in the network by calling the ZigBee PRO API function **ZPS_eAplZdpMatchDescRequest()**, which sends out a match descriptor request (as a broadcast to all network nodes or as unicasts to selected nodes). This function allows nodes to be selectively discovered by looking for specific criteria in the Simple Descriptors of the endpoints on the recipient nodes. These criteria include a list of required input (server) clusters and a list of required output (client) clusters. In this way, an application which supports a particular cluster server or client can discover its cluster counterpart(s) in the rest of the network.

If a recipient node satisfies the criteria specified in a match descriptor request, it will respond with a match descriptor response. This response contains the network address of the responding node and a list of the node's endpoints that satisfy the required criteria - for example, the endpoints that support the specified cluster(s).

Once a relevant node and endpoint have been identified:

- The function **ZPS_eAplZdpIeeeAddrRequest()** can be used to obtain the IEEE/MAC address of the node and then both addresses can be added to the local Address Map using the function **ZPS_eAplZdoAddAddrMapEntry()**.
- If data packets between the two endpoints are to be encrypted by means of standard ZigBee PRO security then one of the two nodes must initiate a link key request using the function **ZPS_eAplZdoRequestKeyReq()**.
- The node can bind a local endpoint to the remote endpoint using the function **ZPS_eAplZdpBindUnbindRequest()**.

Note: All of the above functions are described in the *ZigBee PRO Stack User Guide (JN-UG-3101)*.

4.5 Reading Attributes

Attributes can be read using a general ZCL function, or using an HA or ZCL function which is specific to the target cluster. The cluster-specific functions for reading attributes are covered in the chapters of this manual that describe the supported clusters or in the *ZCL User Guide (JN-UG-3103)*. Note that read access to cluster attributes must be explicitly enabled at compile-time as described in [Section 3.5.1](#).

The remainder of this section describes the use of the ZCL function **eZCL_SendReadAttributesRequest()** to send a 'read attributes' request, although the sequence is similar when using the cluster-specific 'read attributes' functions. The resulting activities on the source and destination nodes are outlined below and illustrated in [Figure 3](#). The events generated from a 'read attributes' request are further described in [Section 4.7](#).

1. On Source Node (Client)

The function **eZCL_SendReadAttributesRequest()** is called to submit a request to read one or more attributes on a cluster on a remote node. The information required by this function includes the following:

- Source endpoint (from which the read request is to be sent)
- Address of destination node for request
- Destination endpoint (on destination node)
- Identifier of the cluster containing the attributes [enumerations provided]
- Number of attributes to be read
- Array of identifiers of attributes to be read [enumerations provided]

2. On Destination Node (Server)

On receiving the 'read attributes' request, the ZCL software on the destination node performs the following steps:

1. Generates an E_ZCL_CBET_READ_REQUEST event for the destination endpoint callback function which, if required, can update the shared device structure that contains the attributes to be read, before the read takes place.
2. Generates an E_ZCL_CBET_LOCK_MUTEX event for the endpoint callback function, which should lock the mutex that protects the shared device structure - for information on mutexes, refer to the *ZCL User Guide (JN-UG-3103)*
3. Reads the relevant attribute values from the shared device structure and creates a 'read attributes' response message containing the read values.
4. Generates an E_ZCL_CBET_UNLOCK_MUTEX event for the endpoint callback function, which should now unlock the mutex that protects the shared device structure (other application tasks can now access the structure).
5. Sends the 'read attributes' response to the source node of the request.

3. On Source Node (Client)

On receiving the 'read attributes' response, the ZCL software on the source node performs the following steps:

1. For each attribute listed in the 'read attributes' response, it generates an E_ZCL_CBET_READ_INDIVIDUAL_ATTRIBUTE_RESPONSE message for the source endpoint callback function, which may or may not take action on this message.
2. On completion of the parsing of the 'read attributes' response, it generates a single E_ZCL_CBET_READ_ATTRIBUTES_RESPONSE message for the source endpoint callback function, which may or may not take action on this message.

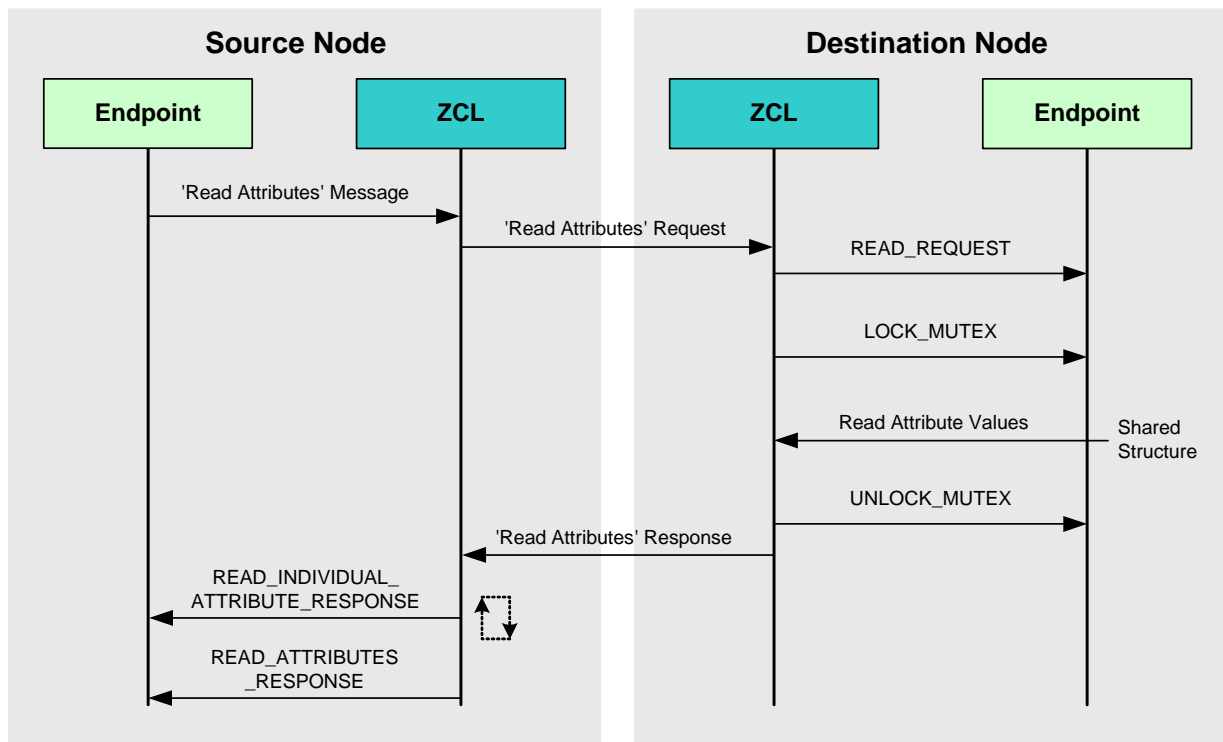

Figure 3: 'Read Attributes' Request and Response

Note: The 'read attributes' requests and responses arrive at their destinations as data messages. Such a message triggers a stack event of the type ZPS_EVENT_APS_DATA_INDICATION, which is handled as described in [Section 4.7](#).

4.6 Writing Attributes

The ability to write attribute values to a remote cluster is required by some HA devices. Normally, a 'write attributes' request is sent from a client cluster to a server cluster, where the relevant attributes in the shared device structure are updated. Note that write access to cluster attributes must be explicitly enabled at compile-time as described in [Section 3.5.1](#).

Three 'write attributes' functions are provided in the ZCL:

- **eZCL_SendWriteAttributesRequest():** This function sends a 'write attributes' request to a remote device, which attempts to update the attributes in its shared structure. The remote device generates a 'write attributes' response to the source device, indicating success or listing error codes for any attributes that it could not update.
- **eZCL_SendWriteAttributesNoResponseRequest():** This function sends a 'write attributes' request to a remote device, which attempts to update the attributes in its shared structure. However, the remote device does not generate a 'write attributes' response, regardless of whether there are errors.
- **eZCL_SendWriteAttributesUndividedRequest():** This function sends a 'write attributes' request to a remote device, which checks that all the attributes can be written to without error:
 - If all attributes can be written without error, all the attributes are updated.
 - If any attribute is in error, all the attributes are left at their existing values.

The remote device generates a 'write attributes' response to the source device, indicating success or listing error codes for attributes that are in error.

The activities surrounding a 'write attributes' request on the source and destination nodes are outlined below and illustrated in [Figure 4](#). The events generated from a 'write attributes' request are further described in [Section 4.7](#).

1. On Source Node (Client)

In order to send a 'write attributes' request, the application on the source node calls one of the above ZCL 'write attributes' functions to submit a request to update the relevant attributes on a cluster on a remote node. The information required by this function includes the following:

- Source endpoint (from which the write request is to be sent)
- Address of destination node for request
- Destination endpoint (on destination node)
- Identifier of the cluster containing the attributes [enumerations provided]
- Number of attributes to be written
- Array of identifiers of attributes to be written [enumerations provided]

2. On Destination Node (Server)

On receiving the 'write attributes' request, the ZCL software on the destination node performs the following steps:

1. For each attribute in the 'write attributes' request, generates an `E_ZCL_CBET_CHECK_ATTRIBUTE_RANGE` event for the destination endpoint callback function. If required, the callback function can do either or both of the following:
 - check that the new attribute value is in the correct range - if the value is out-of-range, the function should set the `eAttributeStatus` field of the event to `E_ZCL_ERR_ATTRIBUTE_RANGE`
 - block the write by setting the `eAttributeStatus` field of the event to `E_ZCL_DENY_ATTRIBUTE_ACCESS`

In the case of an out-of-range value or a blocked write, there is no further processing for that particular attribute following the 'write attributes' request.

2. Generates an `E_ZCL_CBET_LOCK_MUTEX` event for the endpoint callback function, which should lock the mutex that protects the relevant shared device structure - for more on mutexes, refer to the *ZCL User Guide (JN-UG-3103)*.
3. Writes the relevant attribute values to the shared device structure - an `E_ZCL_CBET_WRITE_INDIVIDUAL_ATTRIBUTE` event is generated for each individual attempt to write an attribute value, which the endpoint callback function can use to keep track of the successful and unsuccessful writes.

Note that if an 'undivided write attributes' request was received, an individual failed write will render the whole update process unsuccessful.

4. Generates an `E_ZCL_CBET_WRITE_ATTRIBUTES` event to indicate that all relevant attributes have been processed and, if required, creates a 'write attributes' response message for the source node.
5. Generates an `E_ZCL_CBET_UNLOCK_MUTEX` event for the endpoint callback function, which should now unlock the mutex that protects the shared device structure (other application tasks can now access the structure).
6. If required, sends a 'write attributes' response to the source node of the request.

3. On Source Node (Client)

On receiving an optional 'write attributes' response, the ZCL software on the source node performs the following steps:

1. For each attribute listed in the 'write attributes' response, it generates an `E_ZCL_CBET_WRITE_INDIVIDUAL_ATTRIBUTE_RESPONSE` message for the source endpoint callback function, which may or may not take action on this message. Only attributes for which the write has failed are included in the response and will therefore result in one of these events.
2. On completion of the parsing of the 'write attributes' response, it generates a single `E_ZCL_CBET_WRITE_ATTRIBUTES_RESPONSE` message for the source endpoint callback function, which may or may not take action on this message.

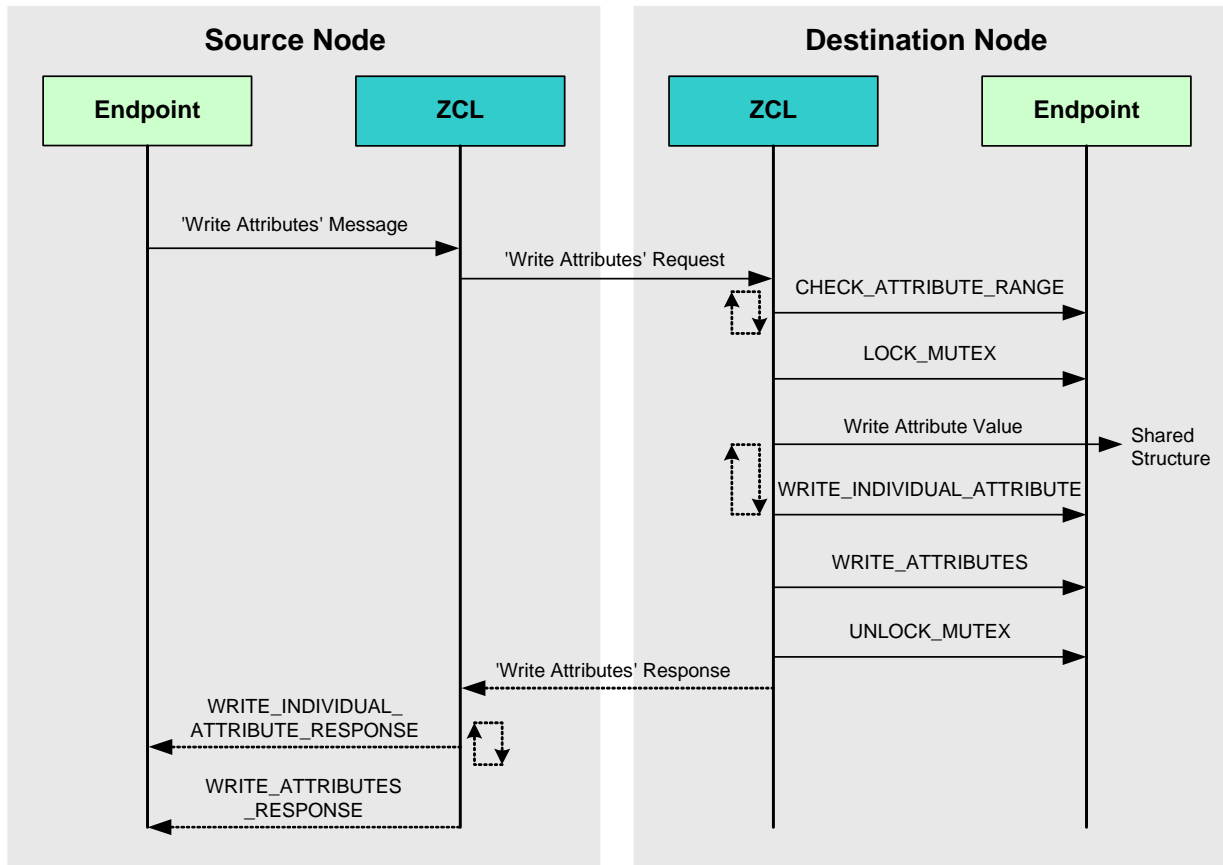

Figure 4: 'Write Attributes' Request and Response

Note: The 'write attributes' requests and responses arrive at their destinations as data messages. Such a message triggers a stack event of the type `ZPS_EVENT_APS_DATA_INDICATION`, which is handled as described in [Section 4.7](#).

4.7 Handling Stack and Timer Events

This section outlines the event handling framework which allows an HA application to deal with stack-related and timer-related events. A stack event is triggered by a message arriving in a message queue and a timer event is triggered when a JenOS timer expires.

The event handling framework for HA is provided by the ZCL. The event must be wrapped in a `tsZCL_CallbackEvent` structure by the application, which then passes this event structure into the ZCL using the function **`vZCL_EventHandler()`**. The ZCL processes the event and, if necessary, invokes the relevant endpoint callback function. This event structure and event handler function are detailed in the *ZCL User Guide (JN-UG-3103)*, which also provides more details of event processing.

The events that are not cluster-specific are divided into four categories, as shown in [Table 27](#) below - these events are described in the *ZCL User Guide (JN-UG-3103)*. Cluster-specific events are covered in the chapter for the relevant cluster.

Category	Event
Input Events	E_ZCL_ZIGBEE_EVENT
	E_ZCL_CBET_TIMER
Read Events	E_ZCL_CBET_READ_REQUEST
	E_ZCL_CBET_READ_INDIVIDUAL_ATTRIBUTE_RESPONSE
	E_ZCL_CBET_READ_ATTRIBUTES_RESPONSE
Write Events	E_ZCL_CBET_CHECK_ATTRIBUTE_RANGE
	E_ZCL_CBET_WRITE_INDIVIDUAL_ATTRIBUTE
	E_ZCL_CBET_WRITE_ATTRIBUTES
	E_ZCL_CBET_WRITE_INDIVIDUAL_ATTRIBUTE_RESPONSE
	E_ZCL_CBET_WRITE_ATTRIBUTES_RESPONSE
General Events	E_ZCL_CBET_LOCK_MUTEX
	E_ZCL_CBET_UNLOCK_MUTEX
	E_ZCL_CBET_DEFAULT_RESPONSE
	E_ZCL_CBET_UNHANDLED_EVENT
	E_ZCL_CBET_ERROR

Table 27: Events (Not Cluster-Specific)

Note: ZCL error events and default responses may be generated when problems occur in receiving commands. The possible ZCL status codes contained in the events and responses are detailed in the *ZCL User Guide (JN-UG-3103)*.

4.8 Servicing Timing Requirements

Some clusters used by an HA application may have timing requirements which demand periodic updates. The function **eHA_Update100mS()** is provided to service these requirements and should be called repeatedly every 100 ms. Invocation of this function can be prompted using a 100-ms software timer.

The function **eHA_Update100mS()** calls the external function **vldEffectTick()**, which must be defined in the application. This user-defined function can be used to implement an identify effect on the node, if required. Otherwise, it should be defined but left empty.

4.9 Time Management

A Home Automation device may need to keep track of time for its own purposes. It is not usually necessary to synchronise time between the nodes of an HA network and therefore an HA device does not normally require the Time cluster. An HA device uses 'ZCL time', which is a time in seconds maintained locally by the device.

In the NXP implementation of the ZigBee Cluster Library, ZCL time on a device is normally derived from a software timer provided by JenOS. In addition, HA requires a 100-ms timer to periodically notify the device when 100 milliseconds have passed. Typically, both of these timings are derived from the same JenOS timer. The maintenance of ZCL time and the 100-ms timing is described in the sub-sections below.

Note: The functions **vZCL_SetUTCTime()** and **vZCL_EventHandler()**, referenced below, are described in the *ZCL User Guide (JN-UG-3103)* and the function **OS_eContinueSWTimer()** is described in the *JenOS User Guide (JN-UG-3075)*.

4.9.1 Time Maintenance

ZCL time should be incremented once per second. In addition, an HA device must be prompted every 100 milliseconds to perform certain periodic operations (e.g. level transitions performed by the Level Control cluster). Normally, the same 100-ms JenOS timer is used for both timings, as follows:

1. On expiration of the 100-ms JenOS timer, an event is generated (from the hardware/software timer that drives the JenOS timer) which causes JenOS to activate an application task.
2. Within this task, the application must call **eHA_Update100mS()** on each activation of the task - this function is described in [Chapter 13](#).
3. Every ten times that the task is activated, the application must also call **vZCL_EventHandler()** with an event type of E_ZCL_CBET_TIMER.

This results in the timer event being passed to the ZCL once per second. On receiving each timer event, the ZCL automatically increments the ZCL time and may run cluster-specific schedulers.

4. The user task must finally resume the 100-ms timer using the JenOS function **OS_eContinueSWTimer()**.

Note 1: The function **eHA_Update100mS()** calls the external function **vldEffectTick()**, which must be defined in the application. This user-defined function can be used to implement an identify effect on the node, if required. Otherwise, it should be defined but left empty.

Note 2: For more information on using the function **vZCL_EventHandler()** to pass a timer event to the ZCL, refer to the 'Processing Events' section of the *ZCL User Guide (JN-UG-3103)*.

4.9.2 Updating ZCL Time Following Sleep

An HA network may include nodes that conserve energy by sleeping between activities. For example:

- A switch device will normally be a sleeping End Device which wakes on an interrupt generated by the switch or dimmer hardware. If a switch supports the Identify cluster, while in identification mode it must wake once per second to generate a timer event - refer to the section on the Identify cluster in the *ZCL User Guide (JN-UG-3103)*.
- A light device is normally configured as a Router, in which case it is always active and therefore does not sleep. If a light device does sleep, it must wake at least once every 100 ms to call **eHA_Update100mS()** and also to generate a timer event once every second (see [Section 4.9.1](#)).

In the case of a device that sleeps, on waking from sleep the application should update the ZCL time using the function **vZCL_SetUTCTime()** according to the duration for which the device was asleep. This requires the sleep duration to be timed.

While sleeping, the JN516x microcontroller normally uses its RC oscillator for timing purposes, which may not maintain the required accuracy for certain applications. In such cases, a more accurate external crystal should be used to time the sleep periods.

The **vZCL_SetUTCTime()** function does not cause timer events to be executed. If the device is awake for less than one second, the application should generate a **E_ZCL_CBET_TIMER** event to prompt the ZCL to run any timer-related functions. Note that when passed into **vZCL_EventHandler()**, this event will increment the ZCL time by one second.

Part II: HA Clusters

5. General Clusters

Many of the clusters used by the HA application profile are provided in the ZigBee Cluster Library (ZCL) and some clusters come from the Smart Energy (SE) profile. This chapter outlines these clusters.

5.1 ZCL Clusters

The HA profile uses the following clusters from the ZigBee Cluster Library (ZCL):

- Basic - see [Section 5.1.1](#)
- Power Configuration - see [Section 5.1.2](#)
- Identify - see [Section 5.1.3](#)
- Groups - see [Section 5.1.4](#)
- Scenes - see [Section 5.1.5](#)
- On/Off - see [Section 5.1.6](#)
- On/Off Switch Configuration - see [Section 5.1.7](#)
- Level Control - see [Section 5.1.8](#)
- Time - see [Section 5.1.9](#)
- Binary Input (Basic) - see [Section 5.1.10](#)
- Door Lock - see [Section 5.1.11](#)
- Thermostat - see [Section 5.1.12](#)
- Thermostat User Interface (UI) Configuration - see [Section 5.1.13](#)
- Colour Control - see [Section 5.1.14](#)
- Illuminance Measurement - see [Section 5.1.15](#)
- Illuminance Level Sensing - see [Section 5.1.16](#)
- Temperature Measurement - see [Section 5.1.17](#)
- Relative Humidity Measurement - see [Section 5.1.18](#)
- Occupancy Sensing - see [Section 5.1.19](#)
- IAS Zone - see [Section 5.1.20](#)
- IAS Ancillary Control Equipment (ACE) - see [Section 5.1.21](#)
- IAS Warning Device (WD) - see [Section 5.1.22](#)

The above clusters are fully detailed in the *ZCL User Guide (JN-UG-3103)*.

Note: In addition to the above ZCL clusters, an HA application may use the EZ-mode Commissioning module. This is also detailed in the *ZCL User Guide (JN-UG-3103)*.

5.1.1 Basic Cluster

The Basic cluster holds basic information about a device/endpoint.

The Basic cluster has a Cluster ID of 0x0000.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...	All HA devices	
Optional in...		Remote Control

Table 28: Basic Cluster in HA Devices

5.1.2 Power Configuration Cluster

The Power Configuration cluster provides functionality relating to the power source(s) of a device.

The Power Configuration cluster has a Cluster ID of 0x0001.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...		
Optional in...	All HA devices	

Table 29: Power Configuration Cluster in HA Devices

5.1.3 Identify Cluster

The Identify cluster allows a device to identify itself (for example, by flashing a LED on the node).

The Identify cluster has a Cluster ID of 0x0003.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...	All HA devices	Door Lock Controller Simple Sensor On/Off Switch On/Off Light Switch Dimmer Switch Colour Dimmer Switch Light Sensor Occupancy Sensor Smart Plug
Optional in...		Level Control Switch Scene Selector Remote Control

Table 30: Identify Cluster in HA Devices

5.1.4 Groups Cluster

The Groups cluster allows the management of the Group table concerned with group addressing.

The Groups cluster has a Cluster ID of 0x0004.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...	On/Off Output Door Lock Simple Sensor On/Off Light Dimmable Light Colour Dimmable Light	Scene Selector Door Lock Controller
Optional in...	Thermostat	On/Off Switch Level Control Switch Remote Control On/Off Light Switch Dimmer Switch Colour Dimmer Switch Light Sensor Occupancy Sensor

Table 31: Groups Cluster in HA Devices

5.1.5 Scenes Cluster

The Scenes cluster allows values that make up a 'scene' to be set and retrieved.

The Scenes cluster has a Cluster ID of 0x0005.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...	On/Off Output Door Lock Simple Sensor On/Off Light Dimmable Light Colour Dimmable Light	Scene Selector Door Lock Controller
Optional in...	Thermostat	On/Off Switch Level Control Switch Remote Control On/Off Light Switch Dimmer Switch Colour Dimmer Switch

Table 32: Scenes Cluster in HA Devices

5.1.6 On/Off Cluster

The On/Off cluster allows a device to be put into the 'on' and 'off' states, or toggled between the two states.

The On/Off cluster has a Cluster ID of 0x0006.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...	On/Off Output On/Off Light Dimmable Light Colour Dimmable Light Smart Plug	On/Off Switch Level Control Switch On/Off Light Switch Dimmer Switch Colour Dimmer Switch
Optional in...		Remote Control

Table 33: On/Off Cluster in HA Devices

5.1.7 On/Off Switch Configuration Cluster

The On/Off Switch Configuration cluster allows the switch type on a device to be defined, as well as the commands to be generated when the switch is moved between its two states.

The On/Off cluster has a Cluster ID of 0x0007.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...		
Optional in...	On/Off Switch Level Control Switch On/Off Light Switch Dimmer Switch Colour Dimmer Switch	Remote Control

Table 34: On/Off Switch Configuration Cluster in HA Devices

5.1.8 Level Control Cluster

The Level Control cluster is used to control the level of a physical quantity on a device (e.g. heat output).

The Level Control cluster has a Cluster ID of 0x0008.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...	Dimmable Light Colour Dimmable Light	Level Control Switch Dimmer Switch Colour Dimmer Switch
Optional in...		Remote Control

Table 35: Level Control Cluster in HA Devices

5.1.9 Time Cluster

The Time cluster is used to maintain a time reference for the transactions in a ZigBee PRO network and to time-synchronise the ZigBee PRO devices.

The Time cluster has a Cluster ID of 0x000A.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...		
Optional in...		All HA devices

Table 36: Time Cluster in HA Devices

5.1.10 Binary Input (Basic) Cluster

The Binary Input (Basic) cluster is used to read the value of a binary measurement representing the state of a two-state physical quantity.

The Binary Input (Basic) cluster has a Cluster ID of 0x000F.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...	Simple Sensor	
Optional in...		

Table 37: Binary Input (Basic) Cluster in HA Devices

5.1.11 Door Lock Cluster

The Door Lock cluster provides an interface to a set values representing the state of a door lock and (optionally) the door.

The Door Lock cluster has a Cluster ID of 0x0101.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...	Door Lock	Door Lock Controller
Optional in...		Remote Control

Table 38: Door Lock Cluster in HA Devices

In Home Automation, the Door Lock cluster is enhanced with an extra optional attribute which allows Application-level security to be used (in addition to the default Network-level security). This enhancement is described in the *ZCL User Guide (JN-UG-3103)*.

5.1.12 Thermostat Cluster

The Thermostat cluster provides an interface for configuring and controlling the functionality of a thermostat.

The Thermostat cluster has a Cluster ID of 0x0201.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...	Thermostat	
Optional in...		Remote Control

Table 39: Thermostat Cluster in HA Devices

5.1.13 Thermostat User Interface (UI) Cluster

The Thermostat UI Configuration cluster provides an interface for configuring the user interface (keypad and/or LCD screen) of a thermostat - this interface may be located on a controlling device which is remote from the thermostat.

The Thermostat UI Configuration cluster has a Cluster ID of 0x0204.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...		
Optional in...	Thermostat	Configuration Tool Combined Interface

Table 40: Thermostat UI Configuration Cluster in HA Devices

5.1.14 Colour Control Cluster

The Colour Control cluster is used to control the colour of a light.

The Colour Control cluster has a Cluster ID of 0x0300.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...	Colour Dimmable Light	Colour Dimmer Switch
Optional in...		Remote Control

Table 41: Colour Control Cluster in HA Devices

When the Colour Control cluster is used with the Scenes cluster in the HA profile, only the mandatory Colour Control cluster attributes `u16CurrentX` and `u16CurrentY` can be stored in and recalled from scenes. To enable this scenes functionality, this definition must be added to the `zcl_options.h` file: `#define HA_RECALL_SCENES`

5.1.15 Illuminance Measurement Cluster

The Illuminance Measurement cluster is used to interface with a set of values related to an illuminance measurement.

The Illuminance Measurement cluster has a Cluster ID of 0x0400.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...	Light Sensor	
Optional in...		Remote Control

Table 42: Illuminance Measurement Cluster in HA Devices

5.1.16 Illuminance Level Sensing Cluster

The Illuminance Level Sensing cluster is used to interface with a set of values related to light-level sensing.

The Illuminance Level Sensing cluster has a Cluster ID of 0x0401.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...		
Optional in...		Remote Control

Table 43: Illuminance Level Sensing Cluster in HA Devices

5.1.17 Temperature Measurement Cluster

The Temperature Measurement cluster is used to interface with a set of values related to a temperature measurement.

The Temperature Measurement cluster has a Cluster ID of 0x0402.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...		
Optional in...		Remote Control

Table 44: Temperature Measurement Cluster in HA Devices

5.1.18 Relative Humidity Measurement Cluster

The Relative Humidity Measurement cluster is used to interface with a set of values related to a relative humidity measurement.

The Relative Humidity Measurement cluster has a Cluster ID of 0x0405.

5.1.19 Occupancy Sensing Cluster

The Occupancy Sensing cluster is used to interface with a set of values related to occupancy sensing.

The Occupancy Sensing cluster has a Cluster ID of 0x0406.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...	Occupancy Sensor	
Optional in...	Thermostat	On/Off Light Dimmable Light Colour Dimmable Light Thermostat

Table 45: Occupancy Sensing Cluster in HA Devices

5.1.20 IAS Zone Cluster

The IAS Zone cluster is used to interface to an IAS Zone device in an IAS (Intruder Alarm System).

The IAS Zone cluster has a Cluster ID of 0x0500.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...	IAS ACE IAS Zone IAS WD	IAS CIE
Optional in...		

Table 46: IAS Zone Cluster in HA Devices

5.1.21 IAS Ancillary Control Equipment (ACE) Cluster

The IAS Ancillary Control Equipment (ACE) cluster provides a control interface to a CIE (Control and Indicating Equipment) device in an IAS (Intruder Alarm System).

The IAS ACE cluster has a Cluster ID of 0x0501.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...	IAS CIE	IAS ACE
Optional in...		

Table 47: IAS ACE Cluster in HA Devices

5.1.22 IAS Warning Device (WD) Cluster

The IAS Warning Device (WD) cluster provides an interface to a Warning Device in an IAS (Intruder Alarm System).

The IAS WD cluster has a Cluster ID of 0x0502.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...	IAS WD	IAS CIE
Optional in...		

Table 48: IAS WD Cluster in HA Devices

5.2 SE Clusters

The HA profile uses the following clusters from the Smart Energy (SE) profile:

- Price - see [Section 5.2.1](#)
- Demand-Response and Load Control (DRLC) - see [Section 5.2.2](#)
- Simple Metering - see [Section 5.2.3](#)

The above clusters are fully detailed in the *ZigBee Smart Energy User Guide (JN-UG-3059)*.

Note: All of these SE clusters are used by the Smart Plug device of the HA profile (see [Section 2.3.7](#)).

5.2.1 Price Cluster

The Price cluster is used to hold and exchange price information for a resource such as electricity.

The Price cluster has a Cluster ID of 0x0700.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...		
Optional in...		Smart Plug

Table 49: Price Cluster in HA Devices

5.2.2 Demand-Response and Load Control (DRLC) Cluster

The Demand-Response and Load Control (DRLC) cluster provides an interface for controlling an attached appliance that supports load control.

The DRLC cluster has a Cluster ID of 0x0701.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...		
Optional in...		Smart Plug

Table 50: DRLC Cluster in HA Devices

5.2.3 Simple Metering Cluster

The Simple Metering cluster is used to handle information relating to the measured consumption of a resource such as electricity.

The Simple Metering cluster has a Cluster ID of 0x0702.

It is required in HA devices as indicated in the table below.

	Server-side	Client-side
Mandatory in...	Smart Plug	
Optional in...		

Table 51: Simple Metering Cluster in HA Devices

6. Poll Control Cluster

This chapter describes the Poll Control cluster which is defined in the ZigBee Home Automation profile, and provides an interface for remotely controlling the rate at which a ZigBee End Device polls its parent for data.

The Poll Control cluster has a Cluster ID of 0x0020.

6.1 Overview

An End Device cannot receive data packets directly, as it may be asleep when a packet arrives. The data packets for an End Device are therefore buffered by the device's parent and the End Device polls its parent for data while awake. An individual data packet will only be held on the parent node for a maximum of 7.68 seconds and if many packets for the End Device are expected over a short period of time, the End Device should retrieve these packets as quickly as possible. An End Device can implement two polling modes, which are dependent on the poll interval (time-period between consecutive polls):

- **Normal poll mode:** A long poll interval is used - this mode is appropriate when the End Device is not expecting data packets
- **Fast poll mode:** A short poll interval is used - this mode is appropriate when the End Device is expecting data packets

The End Device may enable fast poll mode itself when it is expecting data packets (e.g. after it has requested data from remote nodes). The Poll Control cluster allows fast poll mode to be selected from a remote control device to force the End Device to be more receptive to data packets (e.g. when a download to the End Device involving a large number of unsolicited data packets is to be initiated).

The two sides of the cluster are located as follows:

- The cluster server is implemented on the End Device to be controlled
- The cluster client is implemented on the remote controller device

The cluster server (End Device) periodically checks whether the cluster client (remote controller) requires the poll mode to be changed. This 'check-in' method is used since an unsolicited instruction from the controller may arrive when the End Device is asleep. The automatic 'check-ins' are conducted with all the remote endpoints (on controller nodes) to which the local endpoint (on which the cluster resides) is bound.

The cluster is enabled by defining `CLD_POLL_CONTROL` in the `zcl_options.h` file - see [Section 3.5.1](#). Further compile-time options for the Poll Control cluster are detailed in [Section 6.10](#).

6.2 Cluster Structure and Attributes

The structure definition for the Poll Control cluster (server) is:

```
typedef struct
{

    uint32_t      u32CheckinInterval;
    uint32_t      u32LongPollInterval;
    uint16_t      u16ShortPollInterval;
    uint16_t      u16FastPollTimeout;

#ifdef CLD_POLL_CONTROL_ATTR_CHECKIN_INTERVAL_MIN
    uint32_t      u32CheckinIntervalMin;
#endif

#ifdef CLD_POLL_CONTROL_ATTR_LONG_POLL_INTERVAL_MIN
    uint32_t      u32LongPollIntervalMin;
#endif

#ifdef CLD_POLL_CONTROL_ATTR_FAST_POLL_TIMEOUT_MAX
    uint16_t      u16FastPollTimeoutMax;
#endif

} tsCLD_PollControl;
```

where:

- `u32CheckinInterval` is the 'check-in interval', used by the server in checking whether a client requires the poll mode to be changed - this is the period, in quarter-seconds, between consecutive checks. The valid range of values is 1 to 7208960. A user-defined minimum value for this attribute can be set via the optional attribute `u32CheckinIntervalMin` (see below). Zero is a special value indicating that the Poll Control cluster server is disabled. The default value is 14400 (1 hour).
- `u32LongPollInterval` is the 'long poll interval' of the End Device, employed when operating in normal poll mode - this is the period, in quarter-seconds, between consecutive polls of the parent for data. The valid range of values is 4 to 7208960. A user-defined minimum value for this attribute can be set via the optional attribute `u32LongPollIntervalMin` (see below). `0xFFFF` is a special value indicating that the long poll interval is unknown/undefined. The default value is 20 (5 seconds).
- `u16ShortPollInterval` is the 'short poll interval' of the End Device, employed when operating in fast poll mode - this is the period, in quarter-seconds, between consecutive polls of the parent for data. The valid range of values is 1 to 65535 and the default value is 2 (0.5 seconds).

- `u16FastPollTimeout` is the ‘fast poll timeout’ representing the time-interval, in quarter-seconds, for which the server should normally stay in fast poll mode (unless over-ridden by a client command). The valid range of values is 1 to 65535. It is recommended that this timeout is greater than 7.68 seconds. A user-defined maximum value for this attribute can be set via the optional attribute `u16FastPollTimeoutMax` (see below). The default value is 40 (10 seconds).
- `u32CheckinIntervalMin` is an optional lower limit on the ‘check-in interval’ defined by `u32CheckinInterval`. This limit can be used to ensure that the interval is not inadvertently set to a low value which will quickly drain the energy resources of the End Device node.
- `u32LongPollIntervalMin` is an optional lower limit on the ‘long poll interval’ defined by `u32LongPollInterval`. This limit can be used to ensure that the interval is not inadvertently set (e.g. by another device) to a low value which will quickly drain the energy resources of the End Device node.
- `u16FastPollTimeoutMax` is an optional upper limit on the ‘fast poll timeout’ defined by `u16FastPollTimeout`. This limit can be used to ensure that the interval is not inadvertently set (e.g. by another device) to a high value which will quickly drain the energy resources of the End Device node.

Note 1: Valid ranges (maximum and minimum values) for the four mandatory attributes can alternatively be set using macros in the `zcl_options.h` file, as described in [Section 6.10](#). Some of these macros can only be used when the equivalent optional attribute is disabled.

Note 2: For general guidance on attribute settings, refer to [Section 6.3](#). Configuration through the attributes is also described in [Section 6.4.2](#).

6.3 Attribute Settings

In assigning user-defined values to the mandatory attributes, the following inequality should be obeyed:

$$u32CheckinInterval \geq u32LongPollInterval \geq u16ShortPollInterval$$

In addition, the mandatory attribute `u16FastPollTimeout` should not be set to an excessive value for self-powered nodes, as fast poll mode can rapidly drain the stored energy of a node (e.g. the battery).

The three optional attributes can be used to ensure that the values of the corresponding mandatory attributes are kept within reasonable limits, to prevent the rapid depletion of the energy resources of the node. If required, the optional attributes must be enabled and initialised in the compile-time options (see [Section 6.10](#)).

Minimum and maximum values for all the mandatory attributes can alternatively be set using the compile-time options (again, refer to [Section 6.10](#)).

6.4 Poll Control Operations

This section describes the main operations to be performed on the Poll Control cluster server (End Device) and client (controller).

6.4.1 Initialisation

The Poll Control cluster must be initialised on both the cluster server and client. This can be done using the function **eCLD_PollControlCreatePollControl()**, which creates an instance of the Poll Control cluster on a local endpoint.

If you are using a standard ZigBee device which includes the Poll Control cluster, the above function will be automatically called by the initialisation function for the device. You only need to call **eCLD_PollControlCreatePollControl()** explicitly when setting up a custom endpoint containing one or more selected clusters (rather than the whole set of clusters supported by a standard ZigBee device).

6.4.2 Configuration

When initialised, the Poll Control cluster will adopt the attribute values that are pre-set in the `tsCLD_PollControl` structure (see [Section 6.2](#)). For the optional attributes, values can be set in the file `zcl_options.h` (see [Section 6.10](#)).

The mandatory attributes (and related optional attributes) are as follows:

- **Long Poll Interval (`u32LongPollInterval`):** This is the polling period used in normal poll mode, expressed in quarter-seconds, with a default value of 20 (5 seconds). The attribute has a valid range of 4 to 7208960 but a user-defined minimum value for this attribute can be set via the optional 'long poll interval maximum' attribute (`u32LongPollIntervalMin`). This limit can be used to ensure that the interval is not inadvertently set (e.g. by another device) to a low value which will quickly drain the energy resources of the End Device node. Alternatively, minimum and maximum values can be specified through the compile-time options (see [Section 6.10](#)).
- **Short Poll Interval (`u16ShortPollInterval`):** This is the polling period used in fast poll mode, expressed in quarter-seconds, with a default value of 2 (0.5 seconds). The attribute has a valid range of 1 to 65535. User-defined minimum and maximum values for this attribute can be specified through the compile-time options (see [Section 6.10](#)).
- **Fast Poll Timeout (`u16FastPollTimeout`):** This is the time-interval for which the server should normally stay in fast poll mode (unless over-ridden by a client command), expressed in quarter-seconds, with a default value of 40 (10 seconds). It is recommended that this timeout is greater than 7.68 seconds. The valid range of values is 1 to 65535 but a user-defined maximum value for this attribute can be set via the optional 'fast poll timeout maximum' attribute (`u16FastPollTimeoutMax`). This limit can be used to ensure that the interval is not inadvertently set (e.g. by another device) to a high value which will quickly drain the energy resources of the End Device node. Alternatively, minimum and maximum values can be specified through the compile-time options (see [Section 6.10](#)).

- **Check-in Interval (u32CheckinInterval):** This is the period between the server's checks of whether a client requires the poll mode to be changed, expressed in quarter-seconds, with a default value of 14400 (1 hour). It should be greater than the 'long poll interval' (see above). Zero is a special value indicating that the Poll Control cluster server is disabled. Otherwise, the valid range of values is 1 to 7208960 but a user-defined minimum value for this attribute can be set via the optional 'check-in interval minimum' attribute (u32CheckinIntervalMin). This limit can be used to ensure that the interval is not inadvertently set to a low value which will quickly drain the energy resources of the End Device node. Alternatively, minimum and maximum values can be specified through the compile-time options (see [Section 6.10](#)).

The Poll Control cluster server can also be configured by the server application at run-time by writing to the relevant attribute(s) using the **eCLD_PollControlSetAttribute()** function (which must be called separately for each attribute to be modified). If used, this function must be called after the cluster has been initialised (see [Section 6.4.1](#)).

Changes to certain attributes can also be initiated remotely from the cluster client (controller) using the following functions:

- **eCLD_PollControlSetLongPollIntervalSend():** The client application can use this function to submit a request to set the 'long poll interval' attribute on the server to a specified value. This function causes a 'Set Long Poll Interval' command to be sent to the relevant End Device. If the new value is acceptable, the cluster server will automatically update the attribute.
- **eCLD_PollControlSetShortPollIntervalSend():** The client application can use this function to submit a request to set the 'short poll interval' attribute on the server to a specified value. This function causes a 'Set Short Poll Interval' command to be sent to the relevant End Device. If the new value is acceptable, the cluster server will automatically update the attribute.

In both of the above cases, a response will only be sent back to the client if the new value is not acceptable, in which case a ZCL 'default response' will be sent indicating an invalid value.

Use of the above two functions requires the corresponding commands to be enabled in the compile-time options, as described in [Section 6.10](#).

Note: Changes to attribute values initiated by either the server application or client application will take effect immediately. So, for example, if the End Device is operating in fast poll mode when the 'short poll interval' is modified, the polling period will be immediately re-timed to the new value. If the modified attribute is not related to the currently operating poll mode, the change will be implemented the next time the relevant poll mode is started.

Before the first scheduled 'check-in' (after one hour, by default), the End Device application should set up bindings between the local endpoint on which the cluster resides and the relevant endpoint on each remote controller node with which the End Device will operate. These bindings will be used in sending the 'Check-in' commands.

6.4.3 Operation

After initialisation, the Poll Control cluster server on the End Device will begin to operate in normal poll mode and will need to perform the following activities (while the End Device is awake):

- Periodically poll the parent for data packets at a rate determined by the 'long poll interval'
- Periodically check whether any bound cluster clients require the server to enter fast poll mode, with 'check-ins' at a rate determined by the 'check-in interval'

The server application must provide the cluster with timing prompts for the above periodic activities. These prompts are produced by periodically calling the function **eCLD_PollControlUpdate()**. Since the periods of the above activities are defined in terms of quarter-seconds, this function must be called every quarter-second and the application must provide a 250-ms software timer to schedule these calls. Any poll or check-in that is due when this function is called will be automatically performed by the cluster server.

The End Device will operate in normal poll mode until either it puts itself into fast poll mode (e.g. when it is expecting responses to a request) or the controller (client) requests the End Device to enter fast poll mode (e.g. when a data download to the End Device is going to be performed). As indicated above, such a request from the client is raised as the result of the server performing periodic 'check-ins' with the client.

On receiving a 'check-in' command, an `E_CLD_POLL_CONTROL_CMD_CHECK_IN` event is generated on the client. The client application must then fill in the `tsCLD_PollControl_CheckinResponsePayload` structure (see [Section 6.9.2](#)) of the event, indicating whether fast poll mode is required. A response will then be automatically sent back to the server.

After sending the initial Check-in command, the server will wait for up to 7.68 seconds for a response (if no response is received in this time, the server is free to continue in normal poll mode). If a response is received from a client, the event `E_CLD_POLL_CONTROL_CMD_CHECK_IN` will be generated on the server, where this event indicates the processing status of the received response. The server will also send this status back to the responding client in a ZCL default response.

- If the response was received from a bound client within the timeout period of the initial Check-in command, the status will be `ZCL_SUCCESS`. In this case, the End Device will be automatically put into fast poll mode.
- If the response is invalid for some reason, an error status will be indicated as described below in [Section 6.4.3.2](#), and fast poll mode will not be entered.

When the End Device is in fast poll mode, the client application can request the cluster server to exit fast poll mode immediately (before the timeout expires) by calling the function **eCLD_PollControlFastPollStopSend()**.

6.4.3.1 Fast Poll Mode Timeout

In the Check-in response from a client, the payload (see [Section 6.9.2](#)) may contain an optional timeout value which, if used, specifies the length of time that the device should remain in fast poll mode (this timeout value will be used instead of the one specified through the 'fast poll timeout' attribute). If the response payload specifies an out-of-range timeout value, the server will send a ZCL default response with status `INVALID_VALUE` to the client (see [Section 6.4.3.2](#)). In the case of multiple clients (controllers) that have specified different timeout values, the server will use the largest timeout value received.

6.4.3.2 Invalid Check-in Responses

The server may receive Check-in responses which cannot result in fast poll mode. In these cases, the server sends a ZCL default response indicating the relevant error status (which is not `ZCL_SUCCESS`) back to the originating client. The following circumstances will lead to such a default response:

- The Check-in response is from an unbound client. In this case, the Default Response will contain the status `ACTION_DENIED`.
- The Check-in response is from a bound client but requests an invalid fast poll timeout value (see [Section 6.4.3.1](#)). In this case, the default response will contain the status `INVALID_VALUE`.
- The Check-in response is from a bound client but arrives after the timeout period of the original Check-in command. In this case, the default response will contain the status `TIMEOUT`.

6.5 Poll Control Events

The Poll Control cluster has its own events that are handled through the callback mechanism outlined in [Section 4.7](#) (and fully detailed in the *ZCL User Guide* (JN-UG-3103)). The cluster contains its own event handler. However, if a device uses this cluster then application-specific Poll Control event handling must be included in the user-defined callback function for the associated endpoint, where this callback function is registered through the relevant endpoint registration function. This callback function will then be invoked when a Poll Control event occurs and needs the attention of the application.

For a Poll Control event, the `eEventType` field of the `tsZCL_CallBackEvent` structure is set to `E_ZCL_CBET_CLUSTER_CUSTOM`. This event structure also contains an element `sClusterCustomMessage`, which is itself a structure containing a field `pvCustomData`. This field is a pointer to the following `tsCLD_PollControlCallBackMessage` structure:

```
typedef struct
{
    uint8      u8CommandId;
    union
    {
        tsCLD_PollControl_CheckinResponsePayload *psCheckinResponsePayload;
#ifdef CLD_POLL_CONTROL_CMD_SET_LONG_POLL_INTERVAL
        tsCLD_PollControl_SetLongPollIntervalPayload
                                                *psSetLongPollIntervalPayload;
#endif
#ifdef CLD_POLL_CONTROL_CMD_SET_SHORT_POLL_INTERVAL
        tsCLD_PollControl_SetShortPollIntervalPayload
                                                *psSetShortPollIntervalPayload;
#endif
    } uMessage;
} tsCLD_PollControlCallBackMessage;
```

The above structure is fully described in [Section 6.9.1](#).

When a Poll Control event occurs, one of the command types listed in [Table 52](#) is specified through the `u8CommandId` field of the structure `tsCLD_PollControlCallBackMessage`. This command type determines which command payload is used from the union `uMessage`.

u8CommandId Enumeration	Description/Payload Type
On Client	
E_CLD_POLL_CONTROL_CMD_CHECK_IN	A Check-in command has been received by the client.
On Server	
E_CLD_POLL_CONTROL_CMD_CHECK_IN	A Check-in Response has been received by the server, following a previously sent Check-In command. tsCLD_PollControl_CheckinResponsePayload
E_CLD_POLL_CONTROL_CMD_FAST_POLL_STOP	A 'Fast Poll Stop' command has been received by the server.
E_CLD_POLL_CONTROL_CMD_SET_LONG_POLL_INTERVAL	A 'Set Long Poll Interval' command has been received by the server. tsCLD_PollControl_SetLongPollIntervalPayload
E_CLD_POLL_CONTROL_CMD_SET_SHORT_POLL_INTERVAL	A 'Set Short Poll Interval' command has been received by the server. tsCLD_PollControl_SetShortPollIntervalPayload

Table 52: Poll Control Command Types (Events)

6.6 Functions

The Poll Control cluster functions provided in the HA API are described in the following three sub-sections, according to the side(s) of the cluster on which they can be used:

- Server/client function are described in [Section 6.6.1](#)
- Server functions are described in [Section 6.6.2](#)
- Client functions are described in [Section 6.6.3](#)

6.6.1 Server/Client Function

The following Poll Control cluster function is provided in the HA API and can be used on either a cluster server or cluster client:

Function	Page
eCLD_PollControlCreatePollControl	96

eCLD_PollControlCreatePollControl

```
teZCL_Status eCLD_PollControlCreatePollControl(
    tsZCL_ClusterInstance *psClusterInstance,
    bool_t blsServer,
    tsZCL_ClusterDefinition *psClusterDefinition,
    void *pvEndPointSharedStructPtr,
    uint8 *pu8AttributeControlBits,
    tsCLD_PollControlCustomDataStructure
        *psCustomDataStructure);
```

Description

This function creates an instance of the Poll Control cluster on an endpoint. The cluster instance is created on the endpoint which is associated with the supplied `tsZCL_ClusterInstance` structure and can act as a server or a client, as specified.

The function should only be called when setting up a custom endpoint containing one or more selected clusters (rather than the whole set of clusters supported by a standard ZigBee device). This function will create a Poll Control cluster instance on the endpoint, but instances of other clusters may also be created on the same endpoint by calling their corresponding creation functions. For more details of creating cluster instances on custom endpoints, refer to [Appendix A](#).

Note: This function must not be called for an endpoint on which a standard ZigBee device will be used. In this case, the device and its supported clusters must be registered on the endpoint using the relevant device registration function from those described in [Chapter 13](#).

When used, this function must be the first Poll Control cluster function called in the application, and must be called after the stack has been started and after the application profile has been initialised.

The function requires an array to be declared for internal use, which contains one element (of type `uint8`) for each attribute of the cluster. Since the Poll Control cluster client has no attributes, this array is only required for the server. The array length is automatically adjusted by the compiler using the following declaration (for the cluster server):

```
uint8 au8PollControlServerAttributeControlBits
[ (sizeof(asCLD_PollControlClusterAttributeDefinitions) /
  sizeof(tsZCL_AttributeDefinition)) ];
```

Parameters

<i>psClusterInstance</i>	Pointer to structure containing information about the cluster instance to be created (see the <i>ZCL User Guide (JN-UG-3103)</i>). This structure will be updated by the function by initialising individual structure fields.
<i>bIsServer</i>	Type of cluster instance (server or client) to be created: TRUE - server FALSE - client
<i>psClusterDefinition</i>	Pointer to structure indicating the type of cluster to be created (see the <i>ZCL User Guide (JN-UG-3103)</i>). In this case, this structure must contain the details of the Poll Control cluster. This parameter can refer to a pre-filled structure called <code>sCLD_PollControl</code> which is provided in the PollControl.h file.
<i>pvEndPointSharedStructPtr</i>	Pointer to the shared structure used for attribute storage. This parameter should be the address of the structure of type <code>tsCLD_PollControl</code> which defines the attributes of the Poll Control cluster. The function will initialise the attributes with default values.
<i>pu8AttributeControlBits</i>	Pointer to an array of uint8 values, with one element for each attribute in the cluster (see above). For a cluster client, set this pointer to NULL.
<i>psCustomDataStructure</i>	Pointer to a structure containing the storage for internal functions of the cluster (see Section 6.9.5)

Returns

E_ZCL_SUCCESS
 E_ZCL_FAIL
 E_ZCL_ERR_PARAMETER_NULL
 E_ZCL_ERR_INVALID_VALUE

6.6.2 Server Functions

The following Poll Control cluster functions are provided in the HA API and can be used on a cluster server only:

Function	Page
eCLD_PollControlUpdate	99
eCLD_PollControlSetAttribute	100

eCLD_PollControlUpdate

```
teZCL_Status eCLD_PollControlUpdate(void);
```

Description

This function can be used on a cluster server to update the timing status for the following periodic activities:

- polling of the parent for a data packet
- 'check-ins' with the client to check for a required change in the poll mode

The function should be called once per quarter-second and the application should provide a 250-ms timer to prompt these function calls.

Any poll or check-in that is due when this function is called will be automatically performed by the cluster server.

Parameters

None

Returns

E_ZCL_SUCCESS

E_ZCL_FAIL

eCLD_PollControlSetAttribute

```
teZCL_Status eCLD_PollControlSetAttribute(  
    uint8 u8SourceEndPointId,  
    uint8 u8AttributeId,  
    uint32 u32AttributeValue);
```

Description

This function can be used on a cluster server to write to an attribute of the Poll Control cluster. The function will write to the relevant field of the `tsCLD_PollControl` structure (detailed in [Section 6.2](#)). The attribute to be accessed is specified using its attribute identifier - enumerations are provided (see [Section 6.8.1](#)).

Therefore, this function can be used to change the configuration of the Poll Control cluster. The change will take effect immediately. So, for example, if the End Device is in normal poll mode when the 'long poll interval' is modified, the polling period will be immediately re-timed to the new value. If the modified attribute is not related to the currently operating poll mode, the change will be implemented the next time the relevant poll mode is started.

The specified value of the attribute is validated by the function. If this value is out-of-range for the attribute, the status `E_ZCL_ERR_INVALID_VALUE` is returned.

Parameters

<i>u8SourceEndPointId</i>	Number of local endpoint on which cluster resides
<i>u8AttributeId</i>	Identifier of attribute to be written to (see Section 6.8.1)
<i>u32AttributeValue</i>	Value to be written to attribute

Returns

`E_ZCL_SUCCESS`
`E_ZCL_FAIL`
`E_ZCL_ERR_INVALID_VALUE`
`E_ZCL_DENY_ATTRIBUTE_ACCESS`

6.6.3 Client Functions

The following Poll Control cluster functions are provided in the HA API and can be used on a cluster client only:

Function	Page
eCLD_PollControlSetLongPollIntervalSend	102
eCLD_PollControlSetShortPollIntervalSend	104
eCLD_PollControlFastPollStopSend	106

eCLD_PollControlSetLongPollIntervalSend

```
teZCL_Status eCLD_PollControlSetLongPollIntervalSend(  
    uint8 u8SourceEndPointId,  
    uint8 u8DestinationEndPointId,  
    tsZCL_Address *psDestinationAddress,  
    uint8 *pu8TransactionSequenceNumber,  
    tsCLD_PollControl_SetLongPollIntervalPayload  
        *psPayload);
```

Description

This function can be used on a cluster client to send a 'Set Long Poll Interval' command to the cluster server. This command requests the 'long poll interval' for normal poll mode on the End Device to be set to the specified value.

On receiving the command, the 'long poll interval' attribute is only modified by the server if the specified value is within the valid range for the attribute (including greater than or equal to the optional user-defined minimum, if set) - see [Section 6.2](#). If this is not the case, the server replies to the client with a ZCL 'default response' indicating an invalid value.

The change will take effect immediately. So, if the End Device is in normal poll mode when the 'long poll interval' is modified, the polling period will be immediately re-timed to the new value.

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of local endpoint on which cluster client resides
<i>u8DestinationEndPointId</i>	Number of remote endpoint on which cluster server resides
<i>psDestinationAddress</i>	Pointer to a structure containing the destination address of the server node
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>psPayload</i>	Pointer to structure containing the payload for the command (see Section 6.9.3), including the desired long poll interval

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_EP_RANGE
E_ZCL_ERR_EP_UNKNOWN
E_ZCL_ERR_CLUSTER_NOT_FOUND
E_ZCL_ERR_ZBUFFER_FAIL
E_ZCL_ERR_ZTRANSMIT_FAIL

eCLD_PollControlSetShortPollIntervalSend

```
teZCL_Status eCLD_PollControlSetShortPollIntervalSend(  
    uint8 u8SourceEndPointId,  
    uint8 u8DestinationEndPointId,  
    tsZCL_Address *psDestinationAddress,  
    uint8 *pu8TransactionSequenceNumber,  
    tsCLD_PollControl_SetShortPollIntervalPayload  
        *psPayload);
```

Description

This function can be used on a cluster client to send a 'Set Short Poll Interval' command to the cluster server. This command requests the 'short poll interval' for fast poll mode on the End Device to be set to the specified value.

On receiving the command, the 'short poll interval' attribute is only modified by the server if the specified value is within the valid range for the attribute (including greater than or equal to the optional user-defined minimum, if set) - see [Section 6.2](#). If this is not the case, the server replies to the client with a ZCL 'default response' indicating an invalid value.

The change will take effect immediately. So, if the End Device is in fast poll mode when the 'short poll interval' is modified, the polling period will be immediately re-timed to the new value.

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of local endpoint on which cluster client resides
<i>u8DestinationEndPointId</i>	Number of remote endpoint on which cluster server resides
<i>psDestinationAddress</i>	Pointer to a structure containing the destination address of the server node
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>psPayload</i>	Pointer to structure containing the payload for the command (see Section 6.9.4), including the desired short poll interval

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_EP_RANGE
E_ZCL_ERR_EP_UNKNOWN
E_ZCL_ERR_CLUSTER_NOT_FOUND
E_ZCL_ERR_ZBUFFER_FAIL
E_ZCL_ERR_ZTRANSMIT_FAIL

eCLD_PollControlFastPollStopSend

```
teZCL_Status eCLD_PollControlFastPollStopSend(  
    uint8 u8SourceEndPointId,  
    uint8 u8DestinationEndPointId,  
    tsZCL_Address *psDestinationAddress,  
    uint8 *pu8TransactionSequenceNumber);
```

Description

This function can be used on a cluster client to send a 'Fast Poll Stop' command to the cluster server. This command is intended to abort a fast poll mode episode which has been started on the server as the result of a 'Check-in Response'. Therefore, the command allows fast poll mode to be exited before the mode's timeout is reached.

The cluster server will only stop fast poll mode on the destination End Device if a matching 'Fast Poll Stop' command has been received for every request to start the current episode of fast poll mode. Therefore, if the current fast poll mode episode resulted from multiple start requests from multiple clients, the episode cannot be prematurely stopped (before the timeout is reached) unless a 'Fast Poll Stop' command is received from each of those clients.

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of local endpoint on which cluster client resides
<i>u8DestinationEndPointId</i>	Number of remote endpoint on which cluster server resides
<i>psDestinationAddress</i>	Pointer to a structure containing the destination address of the server node
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_EP_RANGE
E_ZCL_ERR_EP_UNKNOWN
E_ZCL_ERR_CLUSTER_NOT_FOUND
E_ZCL_ERR_ZBUFFER_FAIL
E_ZCL_ERR_ZTRANSMIT_FAIL

6.7 Return Codes

The Poll Control cluster functions use the ZCL return codes defined in the *ZCL User Guide* (JN-UG-3103).

6.8 Enumerations

6.8.1 'Attribute ID' Enumerations

The following structure contains the enumerations used to identify the attributes of the Poll Control cluster.

```
typedef enum PACK
{
    E_CLD_POLL_CONTROL_ATTR_ID_CHECKIN_INTERVAL = 0x0000,
    E_CLD_POLL_CONTROL_ATTR_ID_LONG_POLL_INTERVAL,
    E_CLD_POLL_CONTROL_ATTR_ID_SHORT_POLL_INTERVAL,
    E_CLD_POLL_CONTROL_ATTR_ID_FAST_POLL_TIMEOUT,
    E_CLD_POLL_CONTROL_ATTR_ID_CHECKIN_INTERVAL_MIN,
    E_CLD_POLL_CONTROL_ATTR_ID_LONG_POLL_INTERVAL_MIN,
    E_CLD_POLL_CONTROL_ATTR_ID_FAST_POLL_TIMEOUT_MAX
} teCLD_PollControl_Cluster_AttrID;
```

6.8.2 'Command' Enumerations

The following enumerations represent the commands that can be generated by the Poll Control cluster.

```
typedef enum PACK
{
    E_CLD_POLL_CONTROL_CMD_CHECK_IN = 0x00,
    E_CLD_POLL_CONTROL_CMD_FAST_POLL_STOP,
    E_CLD_POLL_CONTROL_CMD_SET_LONG_POLL_INTERVAL,
    E_CLD_POLL_CONTROL_CMD_SET_SHORT_POLL_INTERVAL,
} teCLD_PollControl_CommandID;
```

The above enumerations are used to indicate types of Poll Control cluster events and are described in [Section 6.5](#).

6.9 Structures

6.9.1 tsCLD_PPCCallbackMessage

For a Poll Control event, the `eEventType` field of the `tsZCL_CallbackEvent` structure is set to `E_ZCL_CBET_CLUSTER_CUSTOM`. This event structure also contains an element `sClusterCustomMessage`, which is itself a structure containing a field `pvCustomData`. This field is a pointer to the following `tsCLD_PollControlCallbackMessage` structure:

```
typedef struct
{
    uint8      u8CommandId;
    union
    {
        tsCLD_PollControl_CheckinResponsePayload *psCheckinResponsePayload;
#ifdef CLD_POLL_CONTROL_CMD_SET_LONG_POLL_INTERVAL
        tsCLD_PollControl_SetLongPollIntervalPayload *psSetLongPollIntervalPayload;
#endif
#ifdef CLD_POLL_CONTROL_CMD_SET_SHORT_POLL_INTERVAL
        tsCLD_PollControl_SetShortPollIntervalPayload *psSetShortPollIntervalPayload;
#endif
    } uMessage;
} tsCLD_PollControlCallbackMessage;
```

where:

- `u8CommandId` indicates the type of Poll Control command that has been received, one of:
 - `E_CLD_POLL_CONTROL_CMD_CHECK_IN`
 - `E_CLD_POLL_CONTROL_CMD_FAST_POLL_STOP`
 - `E_CLD_POLL_CONTROL_CMD_SET_LONG_POLL_INTERVAL`
 - `E_CLD_POLL_CONTROL_CMD_SET_SHORT_POLL_INTERVAL`
- If they are required, the last two commands must be enabled in the compile-time options, as described in [Section 6.10](#).
- `uMessage` is a union containing the command payload, as one of (depending on the value of `u8CommandId`):
 - `psCheckinResponsePayload` is a pointer to the payload of a 'Check-in Response' (see [Section 6.9.2](#))
 - `psSetLongPollIntervalPayload` is a pointer to the payload of a 'Set Long Poll Interval' command (see [Section 6.9.3](#))
 - `psSetShortPollIntervalPayload` is a pointer to the payload of a 'Set Short Poll Interval' command (see [Section 6.9.4](#))

The command payload for each command type is indicated in [Table 52](#) in [Section 6.5](#).

6.9.2 tsCLD_PollControl_CheckinResponsePayload

This structure contains the payload of a 'Check-in Response', which is sent from the client to the server in reply to a 'Check-in' command from the server.

```
typedef struct
{
    zbool      bStartFastPolling;
    uint16_t   u16FastPollTimeout;
}tsCLD_PollControl_CheckinResponsePayload;
```

where:

- `bStartFastPolling` is a boolean indicating whether or not the End Device is required to enter fast poll mode:
 - TRUE: Enter fast poll mode
 - FALSE: Continue in normal poll mode
- `u16FastPollTimeout` is an optional fast poll mode timeout, in quarter-seconds, in the range 1 to 65535 - that is, the period of time for which the End Device should remain in fast poll mode (if this mode is requested through `bStartFastPolling`). Zero is a special value which indicates that the value of the 'fast poll timeout' attribute should be used instead (see [Section 6.2](#)). If a non-zero value is specified then this value will over-ride the 'fast poll timeout' attribute (but will not over-write it).

6.9.3 tsCLD_PollControl_SetLongPollIntervalPayload

This structure contains the payload of a 'Set Long Poll Interval' command, which is sent from the client to the server to request a new 'long poll interval' for use in normal poll mode.

```
typedef struct
{
    uint32_t   u32NewLongPollInterval;
}tsCLD_PollControl_SetLongPollIntervalPayload;
```

where `u32NewLongPollInterval` is the required value of the 'long poll interval', in quarter-seconds, in the range 4 to 7208960. This value will be used to over-write the corresponding cluster attribute if the specified value is within the valid range for the attribute (including greater than or equal to the optional user-defined minimum, if set).

To use the 'Set Long Poll Interval' command, it must be enabled in the compile-time options, as described in [Section 6.10](#).

6.9.4 tsCLD_PollControl_SetShortPollIntervalPayload

This structure contains the payload of a 'Set Short Poll Interval' command, which is sent from the client to the server to request a new 'short poll interval' for use in fast poll mode.

```
typedef struct
{
    uint16_t      ul6NewShortPollInterval;
}tsCLD_PollControl_SetShortPollIntervalPayload;
```

where `ul6NewShortPollInterval` is the required value of the 'short poll interval', in quarter-seconds, in the range 1 to 65535. This value will be used to over-write the corresponding cluster attribute if the specified value is within the valid range for the attribute (including greater than or equal to the optional user-defined minimum, if set).

To use the 'Set Short Poll Interval' command, it must be enabled in the compile-time options, as described in [Section 6.10](#).

6.9.5 tsCLD_PollControlCustomDataStructure

The Poll Control cluster requires extra storage space to be allocated to be used by internal functions. The structure definition for this storage is shown below:

```
typedef struct
{
#ifdef POLL_CONTROL_SERVER
    tsCLD_PollControlParameters      sControlParameters;
#endif
    tsZCL_ReceiveEventAddress        sReceiveEventAddress;
    tsZCL_CallBackEvent              sCustomCallBackEvent;
    tsCLD_PollControlCallBackMessage sCallBackMessage;
} tsCLD_PollControlCustomDataStructure;
```

The fields are for internal use and no knowledge of them is required.

6.10 Compile-Time Options

This section describes the compile-time options that may be configured in the **zcl_options.h** file of an application that uses the Poll Control cluster.

To enable the Poll Control cluster in the code to be built, it is necessary to add the following line to the file:

```
#define CLD_POLL_CONTROL
```

In addition, to enable the cluster as a client or server, it is also necessary to add one of the following lines to the same file:

```
#define POLL_CONTROL_SERVER
#define POLL_CONTROL_CLIENT
```

The following options can also be configured at compile-time in the **zcl_options.h** file.

Enable and Set Optional Server Attributes

To enable and assign a value (t quarter-seconds) to the optional Check-in Interval Minimum (u32CheckinIntervalMin) attribute, add the line:

```
#define CLD_POLL_CONTROL_ATTR_CHECKIN_INTERVAL_MIN t
```

To enable and assign a value (t quarter-seconds) to the optional Long Poll Interval Minimum (u32LongPollIntervalMin) attribute, add the line:

```
#define CLD_POLL_CONTROL_ATTR_LONG_POLL_INTERVAL_MIN t
```

To enable and assign a value (t quarter-seconds) to the optional Fast Poll Timeout Maximum (u16FastPollTimeoutMax) attribute, add the line:

```
#define CLD_POLL_CONTROL_ATTR_FAST_POLL_TIMEOUT_MAX t
```

Note: For further information on the above optional server attributes, refer to [Section 6.2](#).

Set Valid Range for 'Check-in Interval'

To set the maximum possible 'check-in interval' (to t quarter-seconds), add the line:

```
#define CLD_POLL_CONTROL_CHECKIN_INTERVAL_MAX t
```

The default value is 7208960.

To set the minimum possible 'check-in interval' (to t quarter-seconds), add the line:

```
#define CLD_POLL_CONTROL_CHECKIN_INTERVAL_MIN t
```

The default value is 0.

This minimum value is only applied if the Check-in Interval Minimum attribute (u32CheckinIntervalMin) is not enabled.

Set Valid Range for 'Fast Poll Timeout'

To set the maximum possible 'fast poll timeout' (to t quarter-seconds), add the line:

```
#define CLD_POLL_CONTROL_FAST_POLL_TIMEOUT_MAX t
```

The default value is 65535.

To set the minimum possible 'fast poll timeout' (to t quarter-seconds), add the line:

```
#define CLD_POLL_CONTROL_FAST_POLL_TIMEOUT_MIN t
```

The default value is 1.

This maximum value is only applied if the Fast Poll Timeout Maximum attribute (u16FastPollTimeoutMax) is not enabled.

Set Valid Range for 'Long Poll Interval'

To set the maximum possible 'long poll interval' (to t quarter-seconds), add the line:

```
#define CLD_POLL_CONTROL_LONG_POLL_INTERVAL_MAX t
```

The default value is 7208960.

To set the minimum possible 'long poll interval' (to t quarter-seconds), add the line:

```
#define CLD_POLL_CONTROL_LONG_POLL_INTERVAL_MIN t
```

The default value is 4.

This minimum value is only applied if the Long Poll Interval Minimum attribute (u32LongPollIntervalMin) is not enabled.

Set Valid Range for 'Short Poll Interval'

To set the maximum possible 'short poll interval' (to t quarter-seconds), add the line:

```
#define CLD_POLL_CONTROL_SHORT_POLL_INTERVAL_MAX t
```

The default value is 65535.

To set the minimum possible 'short poll interval' (to t quarter-seconds), add the line:

```
#define CLD_POLL_CONTROL_SHORT_POLL_INTERVAL_MIN t
```

The default value is 1.

Enable Optional Commands

To enable the optional 'Set Long Poll Interval' command, add the line:

```
#define CLD_POLL_CONTROL_CMD_SET_LONG_POLL_INTERVAL
```

To enable the optional 'Set Short Poll Interval' command, add the line:

```
#define CLD_POLL_CONTROL_CMD_SET_SHORT_POLL_INTERVAL
```

Maximum Number of Clients

To set the maximum number of clients for a server to n , add the line:

```
#define CLD_POLL_CONTROL_NUMBER_OF_MULTIPLE_CLIENTS n
```

This is the maximum number of clients from which the server can handle Check-in Responses. It should be equal to the capacity (number of entries) of the binding table created on the server device to accommodate bindings to client devices (where this size is set in a ZigBee network parameter using the ZPS Configuration Editor).

Disable APS Acknowledgements for Bound Transmissions

To disable APS acknowledgements for bound transmissions from this cluster, add the line:

```
#define CLD_POLL_CONTROL_BOUND_TX_WITH_APS_ACK_DISABLED
```

7. Power Profile Cluster

This chapter describes the Power Profile cluster which is defined in the ZigBee Home Automation profile, and provides an interface between a home appliance (e.g. a washing machine) and the controller of an energy management system.

The Power Profile cluster has a Cluster ID of 0x001A.

7.1 Overview

The Power Profile cluster allows an appliance, the cluster server, to provide its expected power usage data to a controller, the cluster client. This 'power profile' represents the predicted 'energy footprint' of the appliance, and may be used by the controller to schedule and control the operation of the appliance. It may be requested by the client or provided unsolicited by the server.

The cluster is enabled by defining CLD_PP in the **zcl_options.h** file - see [Section 3.5.1](#). Further compile-time options for the Power Profile cluster are detailed in [Section 7.10](#).

Note: The Power Profile cluster requires the Appliance Control cluster for the implementation of status notifications and power management commands. The Appliance Control cluster is described in [Chapter 8](#).

7.2 Cluster Structure and Attributes

The structure definition for the Power Profile cluster (server) is:

```
typedef struct
{
    zuint8    u8TotalProfileNum;
    zbool     bMultipleScheduling;
    zbmap8    u8EnergyFormatting;
    zbool     bEnergyRemote;
    zbmap8    u8ScheduleMode;
} tsCLD_PP;
```

where:

- **u8TotalProfileNum** is the number of power profiles supported by the device (must be between 1 and 254, inclusive)

- `bMultipleScheduling` is a boolean indicating whether the server side of the cluster supports the scheduling of multiple energy phases or just a single energy phase at a time (according to commands received from the client):
 - TRUE if multiple energy phase scheduling is possible
 - FALSE if only single energy phase scheduling is possible
- `u8EnergyFormatting` indicates the format of the Energy fields in the Power Profile Notification and Power Profile Response:
 - Bits 0-2: Number of digits to the right of the decimal point
 - Bits 3-6: Number of digits to the left of the decimal point
 - Bit 7: If set to '1', any leading zeros will be removed
- `bEnergyRemote` is a boolean indicating whether the cluster server (appliance) is configured for remote control (of energy management):
 - TRUE if at least one power profile is enabled for remote control
 - FALSE if no power profile is enabled for remote control

This attribute is linked to the `bPowerProfileRemoteControl` field in the power profile record (see [Section 7.9.13](#)) - if the latter field is set to TRUE, the attribute is also automatically set to TRUE.

- `u8ScheduleMode` indicates the criterion (cheapest or greenest) that should be used by the cluster client (e.g. energy management system) to schedule the power profiles:
 - 0x00 - criterion is left to the cluster server to choose
 - 0x01 - cheapest mode (minimise cost of energy usage)
 - 0x02 - greenest mode (maximise use of renewable energy sources)
 - 0x03 - compromise between cheapest and greenest

All other values are reserved.

7.3 Power Profiles

An appliance can have one or more power profiles. An example of an appliance with multiple power profiles is a washing machine which has a number of programmes for different types of materials and loads.

Note: The number of power profiles on a device must be defined in the file `zcl_options.h` (see [Section 7.10](#)). However, in the current HA release, a device is restricted to having only one power profile.

An individual power profile comprises a series of energy phases with different power demands. For example, these phases may correspond to the different cycles of a washing machine programme, such as wash, rinse, spin. Details of a power profile, including these energy phases, are held in an entry of the power profile table on the cluster server (appliance).

If the appliance is to be remotely controlled, the controller (cluster client) must 'learn' the details of the appliance's power profile so that it can control the scheduling of the energy phases. The schedule of a power profile is decided by the client, and includes energy phases and their relative start-times (the energy phases are not necessarily contiguous in time). A schedule is illustrated in [Figure 5](#). The client must communicate the schedule for a power profile to the server where the schedule will be executed.

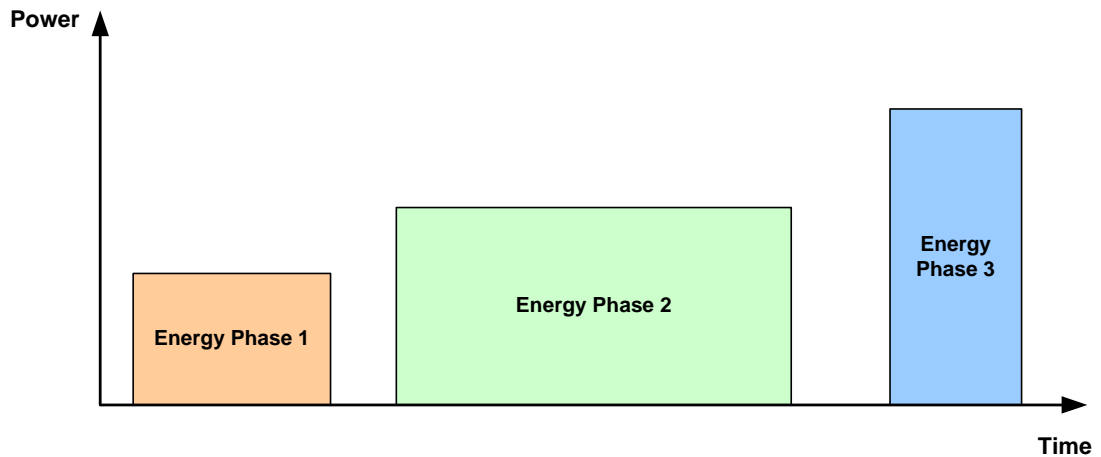

Figure 5: Schedule of Energy Phases of a Power Profile

7.4 Power Profile Operations

This section describes the main operations to be performed on the Power Profile cluster server (appliance) and client (controller).

7.4.1 Initialisation

The Power Profile cluster must be initialised on both the cluster server and client. This can be done using the function **eCLD_PPCreatePowerProfile()**, which creates an instance of the Power Profile cluster on a local endpoint.

If you are using a ZigBee device which includes the Power Profile cluster, the above function will be automatically called by the initialisation function for the device. You only need to call **eCLD_PPCreatePowerProfile()** explicitly when setting up a custom endpoint containing one or more selected clusters (rather than the whole set of clusters supported by a standard ZigBee device).

7.4.2 Adding and Removing a Power Profile (Server Only)

A Power Profile cluster server (appliance) will support one or more power profiles. Information on these power profiles is held on the server in a power profile table, where each table entry contains information on one supported power profile.

Note: In the current HA release, a device is restricted to having only one power profile.

The application on the appliance can perform various operations on the power profile table, as described in the sub-sections below.

7.4.2.1 Adding a Power Profile Entry

The server application can introduce a new power profile by adding a corresponding entry to the power profile table using the function **eCLD_PPAddPowerProfileEntry()**. The new power profile table entry is specified in a `tsCLD_PPEntry` structure (see [Section 7.9.2](#)) supplied to this function. This structure includes the Power Profile ID - these identifiers should be numbered consecutively from 1 to 255.

The function **eCLD_PPAddPowerProfileEntry()** can also be used to replace (overwrite) an existing power profile table entry, in which case the new entry should have the same Power Profile ID as the existing entry to be replaced.

7.4.2.2 Removing a Power Profile Entry

The server application can remove a power profile from the device by calling the function **eCLD_PPRemovePowerProfileEntry()** to delete the corresponding entry of the local power profile table. The entry to be deleted is specified by means of the relevant Power Profile ID.

7.4.2.3 Obtaining a Power Profile Entry

The server application can obtain the details of a power profile supported by the server by reading the corresponding entry of the power profile table using the function **eCLD_PPGetPowerProfileEntry()**. The required entry is specified by means of the relevant Power Profile ID.

7.4.3 Communicating Power Profiles

In order to control the power consumption of the appliance (by scheduling the energy phases of the power profile), the controller (cluster client) must 'learn' the power profiles supported by the appliance (server). This may be done through requests or notifications, as described in the sub-sections below.

Note: In order remotely control the appliance from a controller for energy management, the attribute `bEnergyRemote` of the Power Profile cluster on the server device must be set to TRUE (see [Section 7.2](#)).

7.4.3.1 Requesting a Power Profile (by Client)

In order to 'learn' a power profile supported by the server, the client application can request this profile from the server by calling the **eCLD_PPPowerProfileReqSend()** function, which sends a Power Profile Request to the server. This function can be used to request a specific power profile (specified using its Power Profile ID) or all the power profiles supported by the server.

On receiving the server's response, an `E_CLD_PP_CMD_POWER_PROFILE_RSP` event is generated on the client for each energy phase within the power profile. The reported information is contained in a `tsCLD_PP_PowerProfilePayload` structure (see [Section 7.9.4](#)). The application may store or discard this information, as required. By receiving the energy phase information in individual events, the application only needs to use as much memory as is required to store the relevant energy phase data.

Note: The client application may first use the function **eCLD_PPPowerProfileStateReqSend()** to request the identifiers of the power profiles that are currently supported on the server.

7.4.3.2 Notification of a Power Profile (by Server)

The cluster server may send unsolicited notifications of the power profiles that it supports to the client. To do this, the server application must call the function **eCLD_PPPowerProfileNotificationSend()** which sends a Power Profile Notification containing the essential details of one supported power profile (such as the energy phases within the profile). This information is supplied to the function in a `tsCLD_PP_PowerProfilePayload` structure (see [Section 7.9.4](#)). If the server supports multiple power profiles, a separate notification must be sent for each profile.

On receiving the notification on the client, the event `E_CLD_PP_CMD_POWER_PROFILE_NOTIFICATION` is generated on the client for each energy phase within the power profile. The reported information is contained in a `tsCLD_PP_PowerProfilePayload` structure (see [Section 7.9.4](#)). The application may store or discard this information, as required. By receiving the energy phase information in individual events, the application only needs to use as much memory as is required to store the relevant energy phase data.

7.4.4 Communicating Schedule Information

A power profile schedule comprises a sequence of energy phases and their relative start-times (the energy phases may have gaps between them):

- An energy phase is identified by its Energy Phase Identifier, in the range 1 to 255 (inclusive)
- The start-time of an energy phase is expressed as a delay, in minutes, from the end of the previous energy phase. For the first energy phase of a power profile schedule, this delay is measured from the time that the schedule was started

Note: The normal duration of an energy phase, in minutes, is fixed and is specified in the energy phase information in the power profile.

Although a power profile on the cluster server may support multiple energy phases, the schedule for the power profile may possibly incorporate only a sub-set of these phases. The set of energy phases in a schedule is chosen by the client (controller), which must communicate this schedule to the server (appliance). This may be done through a request or notification, as described in [Section 7.4.4.1](#) and [Section 7.4.4.2](#) below.

7.4.4.1 Requesting a Schedule (by Server)

The server application can request a schedule for a supported power profile from the client by calling the function **eCLD_PPEnergyPhasesScheduleReqSend()**, which sends an Energy Phases Schedule Request to the client.

The client can only return the requested schedule information if it stores this type of information for the power profile. If this is the case, an **E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_REQ** event will be generated on the client, with the **bIsInfoAvailable** field set to **TRUE** in the event structure **tsCLD_PPCallBackMessage**, and the client will send an Energy Phases Schedule Response back to the server. Otherwise, the client will send a ZCL default response with status **NOT_FOUND**.

On receiving an Energy Phases Schedule Response from the client, the event **E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_RSP** is generated on the server, containing the requested schedule information in a **tsCLD_PP_EnergyPhasesSchedulePayload** structure (see [Section 7.9.6](#)). One or more of the following outcomes will result:

- If the attribute **bEnergyRemote** is set to **FALSE** on the server (no remote control of the device), the server will simply reject the received schedule.
- If the received schedule information contains an **ul6MaxActivationDelay** value of zero for an energy phase (see [Section 7.9.11](#)), this energy phase will be rejected by the server although other valid energy phases will be accepted. For each rejected energy phase, the server will send a ZCL default response with status **NOT_AUTHORIZED** to the client.
- If the received schedule information results in an update of the power profile schedule on the server, the server will automatically send an Energy Phases Schedule State Notification back to the client. On receiving this notification, an **E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_STATE_NOTIFICATION** event will be generated on the client.

Note: Before requesting a power profile schedule, the server application may send the schedule's timing constraints to the client using the function **eCLD_PPPowerProfileScheduleConstraintsNotificationSend()**. The client application can alternatively request these schedule constraints from the server by calling **eCLD_PPPowerProfileScheduleConstraintsReqSend()**.

7.4.4.2 Notification of a Schedule (by Client)

The cluster client may send an unsolicited notification of a power profile schedule to the server. To do this, the client application must call the function **eCLD_PPEnergyPhasesScheduleNotificationSend()** which sends an Energy Phases Schedule Notification containing the schedule. This information is supplied to the function in a **tsCLD_PP_EnergyPhasesSchedulePayload** structure (see [Section 7.9.6](#)).

On receiving the notification on the server, the event `E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_NOTIFICATION` is generated, containing the sent power profile schedule. One or more of the following outcomes will result:

- If the attribute `bEnergyRemote` is set to `FALSE` on the server (no remote control of the device), the server will simply reject the received schedule.
- If the received schedule information contains an `ul6MaxActivationDelay` value of zero for an energy phase (see [Section 7.9.11](#)), this energy phase will be rejected by the server although other valid energy phases will be accepted. For each rejected energy phase, the server will send a ZCL default response with status `NOT_AUTHORIZED` to the client.
- If the received schedule information results in an update of the power profile schedule on the server, the server will automatically send an Energy Phases Schedule State Notification back to the client. On receiving this notification, an `E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_STATE_NOTIFICATION` event will be generated on the client.

7.4.4.3 Notification of Energy Phases in Power Profile Schedule (by Server)

The server application can use the function **`eCLD_PP_EnergyPhasesScheduleStateNotificationSend()`** to send an unsolicited Energy Phases Schedule State Notification to a cluster client, in order to inform the client of the energy phases that are in the schedule of a particular power profile.

7.4.4.4 Requesting the Scheduled Energy Phases (by Client)

The client application can use the function **`eCLD_PP_EnergyPhasesScheduleStateReqSend()`** to send an Energy Phases Schedule State Request to the cluster server, in order to obtain the schedule of energy phases for a particular power profile on the server.

On receiving the response on the client, the event `E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_STATE_RSP` is generated, containing the requested schedule information. The obtained schedule can be used to re-align the schedule information on the client with the information on the server - for example, after a reset of the client device.

7.4.5 Executing a Power Profile Schedule

After receiving a power profile schedule from the client (as described in [Section 7.4.4](#)), the server can start execution of the schedule. The instruction to start the schedule comes from the client in the form of an Energy Phases Schedule Notification. To issue this instruction, the client application must call the function **`eCLD_PP_EnergyPhasesScheduleNotificationSend()`**. On receiving the notification, the server will automatically start the schedule.

The possible states of a power profile are fully detailed in [Section 7.8.2](#) but, generally, it will move through the following principal states before, during and after execution:

- **E_CLD_PP_STATE_PROGRAMMED:** The power profile is defined in the local power profile table but a schedule has not been received from the client. Even without a schedule from the client, a schedule of energy phases that was defined when the power profile was introduced using the function **eCLD_PPAddPowerProfileEntry()** can be started from this state (see below).
- **E_CLD_PP_STATE_WAITING_TO_START:** The power profile will be in this state before the first energy phase starts and between energy phases (provided there is a gap between the end of one phase and the beginning of the next).
- **E_CLD_PP_STATE_RUNNING:** An energy phase is running.
- **E_CLD_PP_STATE_ENDED:** The final energy phase has completed.

Once a schedule has started, the server application must progress execution through the different states of the schedule by periodically calling the function **eCLD_PPSchedule()** once per second. This function will move the power profile to the next state, if it is due to start, and update the relevant state and timing parameters.

Note: The server application can also use the function **eCLD_PPSetPowerProfileState()** to 'manually' move execution of the schedule to a particular (valid) state, irrespective of whether the target state is scheduled. This function can be used by the server application to locally start a schedule from the 'programmed' state.

Whenever there is a change of state of a power profile, the cluster server will automatically send a Power Profile State Notification to the client (the server application can also send such a notification 'manually' by calling the function **eCLD_PPPowerProfileStateNotificationSend()**). The notification contains a power profile record which specifies the active power profile, the energy phase that is currently running (or due to run next) and the current state of the power profile. These notifications allow the controller to monitor the appliance. On receiving a notification on the client, an **E_CLD_PP_CMD_POWER_PROFILE_STATE_NOTIFICATION** event is generated, containing the sent power profile state information in a **tsCLD_PP_PowerProfileStatePayload** structure (see [Section 7.9.5](#)).

7.4.6 Communicating Price Information

The cost of implementing a power profile schedule on an appliance (cluster server) is determined/calculated by the controller (cluster client). The server can request price information from the client in a number of ways, as described below.

Note: Use of the Power Profile Price functions, referenced below, must be enabled in the compile-time options, as described in [Section 7.10](#).

7.4.6.1 Requesting Cost of a Power Profile Schedule (by Server)

The server application can use the function **eCLD_PPGetPowerProfilePriceSend()** to send a Get Power Profile Price Request to the client, in order to request the cost of executing the schedule of a particular power profile.

The client can only return the requested information if price-related information about the power profile is held on the client device. If this is the case, an **E_CLD_PP_CMD_GET_POWER_PROFILE_PRICE** event will be generated on the client, with the **bIsInfoAvailable** field set to **TRUE** in the event structure **tsCLD_PPCallBackMessage** and the client will send a Get Power Profile Price Response back to the server. Otherwise, the client will send a ZCL default response with status **NOT_FOUND**.

On receiving a Get Power Profile Price Response on the server, the event **E_CLD_PP_CMD_GET_POWER_PROFILE_PRICE_RSP** is generated, containing the requested price information (if available).

Alternatively, the server application can use the function **eCLD_PPGetPowerProfilePriceExtendedSend()** to send a Get Power Profile Price Extended Request to a cluster client, in order to request specific cost information about a power profile supported by the server. The cost of executing a power profile can be requested with either scheduled energy phases or contiguous energy phases (no gaps between them). This request will be handled by the client as described above for an ordinary Get Power Profile Price Request. However, the response will result in an **E_CLD_PP_CMD_GET_POWER_PROFILE_PRICE_EXTENDED_RSP** event on the server, containing the requested price information (if available).

7.4.6.2 Requesting Cost of Power Profile Schedules Over a Day (by Server)

The server application can use the **eCLD_PPGetOverallSchedulePriceSend()** function to send a Get Overall Schedule Price Request to the client, in order to obtain the overall cost of all the power profiles that will be executed over the next 24 hours.

The client can only return the requested information if price-related information about the relevant power profiles is held on the client device. If this is the case, an **E_CLD_PP_CMD_GET_OVERALL_SCHEDULE_PRICE** event will be generated on the client, with the **bIsInfoAvailable** field set to **TRUE** in the event structure **tsCLD_PPCallBackMessage**. Otherwise, the client will generate a ZCL default response with status **NOT_FOUND**.

On receiving a Get Overall Schedule Price Response on the server, the event **E_CLD_PP_CMD_GET_OVERALL_SCHEDULE_PRICE_RSP** is generated, containing the requested price information (if available).

7.5 Power Profile Events

The Power Profile cluster has its own events that are handled through the callback mechanism outlined in [Section 4.7](#) (and fully detailed in the *ZCL User Guide* (JN-UG-3103)). The cluster contains its own event handler. However, if a device uses this cluster then application-specific Power Profile event handling must be included in the user-defined callback function for the associated endpoint, where this callback function is registered through the relevant endpoint registration function. This callback function will then be invoked when a Power Profile event occurs and needs the attention of the application.

For a Power Profile event, the `eEventType` field of the `tsZCL_CallBackEvent` structure is set to `E_ZCL_CBET_CLUSTER_CUSTOM`. This event structure also contains an element `sClusterCustomMessage`, which is itself a structure containing a field `pvCustomData`. This field is a pointer to the following `tsCLD_PPCallBackMessage` structure:

```
typedef struct
{
    uint8          u8CommandId;
#ifdef PP_CLIENT
    bool           bIsInfoAvailable;
#endif
    union
    {
        {
            tsCLD_PP_PowerProfileReqPayload *psPowerProfileReqPayload;
            tsCLD_PP_GetPowerProfilePriceExtendedPayload
                *psGetPowerProfilePriceExtendedPayload;
        } uReqMessage;
        union
        {
            tsCLD_PP_GetPowerProfilePriceRspPayload *psGetPowerProfilePriceRspPayload;
            tsCLD_PP_GetOverallSchedulePriceRspPayload
                *psGetOverallSchedulePriceRspPayload;
            tsCLD_PP_EnergyPhasesSchedulePayload *psEnergyPhasesSchedulePayload;
            tsCLD_PP_PowerProfileScheduleConstraintsPayload
                *psPowerProfileScheduleConstraintsPayload;
            tsCLD_PP_PowerProfilePayload *psPowerProfilePayload;
            tsCLD_PP_PowerProfileStatePayload *psPowerProfileStatePayload;
        } uRespMessage;
    }
} tsCLD_PPCallBackMessage;
```

The above structure is fully described in [Section 7.9.1](#).

When a Power Profile event occurs, one of the command types listed in [Table 53](#) and [Table 54](#) is specified through the `u8CommandId` field of the `tsCLD_PPCallBackMessage` structure. This command type determines which command payload is used from the unions `uReqMessage` (for request commands) and `uRespMessage` (for response and notification commands).

u8CommandId Enumeration	Description/Payload Type
E_CLD_PP_CMD_POWER_PROFILE_REQ	A Power Profile Request has been received by the server (appliance). tsCLD_PP_PowerProfileReqPayload
E_CLD_PP_CMD_POWER_PROFILE_STATE_REQ	A Power Profile State Request has been received by the server (appliance).
E_CLD_PP_CMD_GET_POWER_PROFILE_PRICE_RSP	A Get Power Profile Price Response has been received by the server (appliance), following a previously sent Get Power Profile Price Request. tsCLD_PP_GetPowerProfilePriceRspPayload
E_CLD_PP_CMD_GET_POWER_PROFILE_PRICE_EXTENDED_RSP	A Get Power Profile Price Extended Response has been received by the server (appliance), following a previously sent Get Power Profile Price Extended Request. tsCLD_PP_GetPowerProfilePriceRspPayload
E_CLD_PP_CMD_GET_OVERALL_SCHEDULE_PRICE_RSP	A Get Overall Schedule Price Response has been received by the server (appliance), following a previously sent Get Overall Schedule Price Request. tsCLD_PP_GetOverallSchedulePriceRspPayload
E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_NOTIFICATION	An Energy Phases Schedule Notification has been received by the server (appliance). tsCLD_PP_EnergyPhasesSchedulePayload
E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_RSP	An Energy Phases Schedule Response has been received by the server (appliance), following a previously sent Energy Phases Schedule Request. tsCLD_PP_EnergyPhasesSchedulePayload
E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_STATE_RSP	An Energy Phases Schedule State Response has been received by the server (appliance), following a previously sent Energy Phases Schedule State Request. tsCLD_PP_EnergyPhasesSchedulePayload
E_CLD_PP_CMD_GET_POWER_PROFILE_SCHEDULE_CONSTRAINTS_REQ	A Get Power Profile Schedule Constraints Request has been received by the server (appliance). tsCLD_PP_PowerProfileReqPayload
E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_STATE_REQ	An Energy Phases Schedule State Request has been received by the server (appliance). tsCLD_PP_PowerProfileReqPayload

Table 53: Power Profile Command Types (Events on Server)

u8CommandId Enumeration	Description/Payload Type
E_CLD_PP_CMD_POWER_PROFILE_NOTIFICATION	A Power Profile Notification has been received by the client (controller). tsCLD_PP_PowerProfilePayload
E_CLD_PP_CMD_POWER_PROFILE_STATE_NOTIFICATION	A Power Profile State Notification has been received by the client (controller). tsCLD_PP_PowerProfileStatePayload
E_CLD_PP_CMD_POWER_PROFILE_RSP	A Power Profile Response has been received by the client (controller), following a previously sent Power Profile Request. tsCLD_PP_PowerProfilePayload
E_CLD_PP_CMD_POWER_PROFILE_STATE_RSP	A Power Profile State Response has been received by the client (controller), following a previously sent Power Profile State Request. tsCLD_PP_PowerProfileStatePayload
E_CLD_PP_CMD_GET_POWER_PROFILE_PRICE	A Get Power Profile Price Request has been received by the client (controller). tsCLD_PP_PowerProfileReqPayload
E_CLD_PP_CMD_GET_OVERALL_SCHEDULE_PRICE	A Get Overall Schedule Price Request has been received by the client (controller).
E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_REQ	An Energy Phases Schedule Request has been received by the client (controller). tsCLD_PP_PowerProfileReqPayload
E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_STATE_NOTIFICATION	An Energy Phases Schedule State Notification has been received by the client (controller). tsCLD_PP_EnergyPhasesSchedulePayload
E_CLD_PP_CMD_SCHEDULE_CONSTRAINTS_NOTIFICATION	A Power Profile Schedule Constraints Notification has been received by the client (controller). tsCLD_PP_PowerProfileScheduleConstraintsPayload
E_CLD_PP_CMD_GET_POWER_PROFILE_SCHEDULE_CONSTRAINTS_RSP	A Power Profile Schedule Constraints Response has been received by the client (controller). tsCLD_PP_PowerProfileScheduleConstraintsPayload
E_CLD_PP_CMD_GET_POWER_PROFILE_PRICE_EXTENDED	A Get Power Profile Price Extended Request has been received by the client (controller). tsCLD_PP_GetPowerProfilePriceExtendedPayload

Table 54: Power Profile Command Types (Events on Client)

7.6 Functions

The Power Profile cluster functions provided in the HA API are described in the following three sub-sections, according to the side(s) of the cluster on which they can be used:

- Server/client function are described in [Section 7.6.1](#)
- Server functions are described in [Section 7.6.2](#)
- Client functions are described in [Section 7.6.3](#)

7.6.1 Server/Client Function

The following Power Profile cluster function is provided in the HA API and can be used on either a cluster server or cluster client:

Function	Page
eCLD_PPCreatePowerProfile	127

eCLD_PPCreatePowerProfile

```
teZCL_Status eCLD_PPCreatePowerProfile(
    tsZCL_ClusterInstance *psClusterInstance,
    bool_t blsServer,
    tsZCL_ClusterDefinition *psClusterDefinition,
    void *pvEndPointSharedStructPtr,
    uint8 *pu8AttributeControlBits,
    tsCLD_PPCustomDataStructure
        *psCustomDataStructure);
```

Description

This function creates an instance of the Power Profile cluster on an endpoint. The cluster instance is created on the endpoint which is associated with the supplied `tsZCL_ClusterInstance` structure and can act as a server or a client, as specified.

The function should only be called when setting up a custom endpoint containing one or more selected clusters (rather than the whole set of clusters supported by a standard ZigBee device). This function will create a Power Profile cluster instance on the endpoint, but instances of other clusters may also be created on the same endpoint by calling their corresponding creation functions. For more details of creating cluster instances on custom endpoints, refer to [Appendix A](#).

Note: This function must not be called for an endpoint on which a standard ZigBee device will be used. In this case, the device and its supported clusters must be registered on the endpoint using the relevant device registration function from those described in [Chapter 13](#).

When used, this function must be the first Power Profile cluster function called in the application, and must be called after the stack has been started and after the application profile has been initialised.

The function requires an array to be declared for internal use, which contains one element (of type `uint8`) for each attribute of the cluster. Since the Power Profile cluster client has no attributes, this array is only required for the server. The array length is automatically adjusted by the compiler using the following declaration (for the cluster server):

```
uint8 au8PowerProfileServerAttributeControlBits
[(sizeof(asCLD_PowerProfileClusterAttributeDefinitions) /
sizeof(tsZCL_AttributeDefinition))];
```

Parameters

<i>psClusterInstance</i>	Pointer to structure containing information about the cluster instance to be created (see the <i>ZCL User Guide (JN-UG-3103)</i>). This structure will be updated by the function by initialising individual structure fields.
<i>bIsServer</i>	Type of cluster instance (server or client) to be created: TRUE - server FALSE - client
<i>psClusterDefinition</i>	Pointer to structure indicating the type of cluster to be created (see the <i>ZCL User Guide (JN-UG-3103)</i>). In this case, this structure must contain the details of the Power Profile cluster. This parameter can refer to a pre-filled structure called <code>sCLD_PP</code> which is provided in the PowerProfile.h file.
<i>pvEndPointSharedStructPtr</i>	Pointer to the shared structure used for attribute storage. This parameter should be the address of the structure of type <code>t_sCLD_PP</code> which defines the attributes of the Power Profile cluster. The function will initialise the attributes with default values.
<i>pu8AttributeControlBits</i>	Pointer to an array of uint8 values, with one element for each attribute in the cluster (see above). For a cluster client, set this pointer to NULL.
<i>psCustomDataStructure</i>	Pointer to a structure containing the storage for internal functions of the cluster (see Section 7.9.14)

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_INVALID_VALUE

7.6.2 Server Functions

The following Power Profile cluster functions are provided in the HA API and can be used on a cluster server only:

Function	Page
eCLD_PPSchedule	130
eCLD_PPSetPowerProfileState	131
eCLD_PPAddPowerProfileEntry	132
eCLD_PPRemovePowerProfileEntry	133
eCLD_PPGetPowerProfileEntry	134
eCLD_PPPowerProfileNotificationSend	135
eCLD_PPEnergyPhaseScheduleStateNotificationSend	136
eCLD_PPPowerProfileScheduleConstraintsNotificationSend	137
eCLD_PPEnergyPhasesScheduleReqSend	139
eCLD_PPPowerProfileStateNotificationSend	140
eCLD_PPGetPowerProfilePriceSend	141
eCLD_PPGetPowerProfilePriceExtendedSend	142
eCLD_PPGetOverallSchedulePriceSend	144

eCLD_PPSchedule

```
teZCL_Status eCLD_PPSchedule(void);
```

Description

This function can be used on a cluster server to update the state of the currently active power profile and the timings required for scheduling. When called, the function automatically makes any required changes according to the scheduled energy phases for the power profile. If no change is scheduled, the function only updates timing information. If a change is required, it also updates the power profile state and the ID of the energy phase currently being executed.

The function should be called once per second to progress the active power profile schedule and the application should provide a 1-second timer to prompt these function calls.

Parameters

None

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_INVALID_VALUE

eCLD_PPSetPowerProfileState

```
teZCL_CommandStatus eCLD_PPSetPowerProfileState(
    uint8 u8SourceEndPointId,
    uint8 u8PowerProfileId,
    teCLD_PP_PowerProfileState sPowerProfileState);
```

Description

This function can be used on a cluster server to move the specified power profile to the specified target state. Enumerations for the possible states are provided, and are listed and described in [Section 7.8.2](#).

The function performs the following checks:

- Checks whether the specified Power Profile ID exists (if not, the function returns with the status E_ZCL_CMDS_NOT_FOUND)
- Checks whether the specified target state is a valid state (if not, the function returns with the status E_ZCL_CMDS_INVALID_VALUE)
- Checks whether the power profile is currently able move to the target state (if not, the function returns with the status E_ZCL_CMDS_INVALID_FIELD)

Note: The power profile state can be changed by this function only if the move from the existing state to the target state is a valid change according to the HA specification.

If all the checks are successful, the move is implemented (and the function returns with the status E_ZCL_CMD_SUCCESS).

Parameters

<i>u8SourceEndPointId</i>	Number of local endpoint on which cluster resides
<i>u8PowerProfileId</i>	Identifier of the power profile
<i>sPowerProfileState</i>	Target state to which power profile is to be moved - enumerations are provided (see Section 7.8.2)

Returns

E_ZCL_CMD_SUCCESS
E_ZCL_CMDS_NOT_FOUND
E_ZCL_CMDS_INVALID_VALUE
E_ZCL_CMDS_INVALID_FIELD

eCLD_PPAddPowerProfileEntry

```
teZCL_Status eCLD_PPAddPowerProfileEntry(  
    uint8 u8SourceEndPointId,  
    tsCLD_PPEntry *psPowerProfileEntry);
```

Description

This function can be used on a cluster server to introduce a new power profile by adding an entry to the local power profile table.

The function checks whether there is sufficient space in the table for the new power profile entry (if not, the function returns with the status `E_ZCL_ERR_INSUFFICIENT_SPACE`).

An existing power profile entry can be over-written with a new profile by specifying the same Power Profile ID (in the new entry structure).

The function will also update two of the cluster attributes (if needed), as follows.

- If a power profile is introduced which has multiple energy phases (as indicated by the `u8NumOfScheduledEnergyPhases` field of the `tsCLD_PPEntry` structure), the attribute `bMultipleScheduling` will be set to `TRUE` (if not already `TRUE`)
- If a power profile is introduced which allows remote control for energy management (as indicated by the `bPowerProfileRemoteControl` field of the `tsCLD_PPEntry` structure), the attribute `bEnergyRemote` will be set to `TRUE` (if not already `TRUE`)

Parameters

<i>u8SourceEndPointId</i>	Number of local endpoint on which cluster resides
<i>psPowerProfileEntry</i>	Structure containing the power profile to add (see Section 7.9.2)

Returns

`E_ZCL_SUCCESS`
`E_ZCL_FAIL`
`E_ZCL_ERR_PARAMETER_NULL`
`E_ZCL_ERR_INSUFFICIENT_SPACE`

eCLD_PPRemovePowerProfileEntry

```
teZCL_Status eCLD_PPRemovePowerProfileEntry(  
    uint8 u8SourceEndPointId,  
    uint8 u8PowerProfileId);
```

Description

This function can be used on a cluster server to remove a power profile by deleting the relevant entry in the local power profile table.

Parameters

<i>u8SourceEndPointId</i>	Number of local endpoint on which cluster resides
<i>u8PowerProfileId</i>	Identifier of power profile to be removed

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL

eCLD_PPGetPowerProfileEntry

```
teZCL_Status eCLD_PPGetPowerProfileEntry(  
    uint8 u8SourceEndPointId,  
    uint8 u8PowerProfileId,  
    tsCLD_PPEntry **ppsPowerProfileEntry);
```

Description

This function can be used on a cluster server to obtain an entry from the local power profile table. The required entry is specified using the relevant Power Profile ID. The function obtains a pointer to the relevant entry, if it exists - a pointer must be provided to a location to receive the pointer to the entry.

If no entry with the specified Power Profile ID is found, the function returns E_ZCL_ERR_INVALID_VALUE.

Parameters

<i>u8SourceEndPointId</i>	Number of local endpoint on which cluster resides
<i>u8PowerProfileId</i>	Identifier of power profile to be obtained
<i>ppsPowerProfileEntry</i>	Pointer to a location to receive a pointer to the required power profile table entry (see Section 7.9.2)

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_INVALID_VALUE

eCLD_PPPowerProfileNotificationSend

```
teZCL_Status eCLD_PPPowerProfileNotificationSend(
    uint8 u8SourceEndPointId,
    uint8 u8DestinationEndPointId,
    tsZCL_Address *psDestinationAddress,
    uint8 *pu8TransactionSequenceNumber,
    tsCLD_PP_PowerProfilePayload *psPayload);
```

Description

This function can be used on the cluster server to send a Power Profile Notification to a cluster client, in order to inform the client about one power profile supported by the server. The notification contains essential information about the power profile, including the energy phases supported by the profile (and certain details about them). If the server supports multiple power profiles, the function must be called for each profile separately.

On receiving the notification on the client, the event `E_CLD_PP_CMD_POWER_PROFILE_NOTIFICATION` will be generated, containing the sent power profile information in a `tsCLD_PP_PowerProfilePayload` structure (see [Section 7.9.4](#)).

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of local endpoint on which cluster server resides
<i>u8DestinationEndPointId</i>	Number of remote endpoint on which cluster client resides
<i>psDestinationAddress</i>	Pointer to a structure containing the destination address of the client node
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>psPayload</i>	Pointer to structure containing the payload for the request (see Section 7.9.4), including essential information about the power profile

Returns

`E_ZCL_SUCCESS`
`E_ZCL_FAIL`
`E_ZCL_ERR_EP_UNKNOWN`
`E_ZCL_ERR_ZBUFFER_FAIL`
`E_ZCL_ERR_ZTRANSMIT_FAIL`

eCLD_PP_EnergyPhasesScheduleStateNotificationSend

```
teZCL_Status  
eCLD_PP_EnergyPhasesScheduleStateNotificationSend(  
    uint8 u8SourceEndPointId,  
    uint8 u8DestinationEndPointId,  
    tsZCL_Address *psDestinationAddress,  
    uint8 *pu8TransactionSequenceNumber,  
    tsCLD_PP_EnergyPhasesSchedulePayload  
        *psPayload);
```

Description

This function can be used on the cluster server to send an Energy Phases Schedule State Notification to a cluster client, in order to inform the client of the energy phases that are in the schedule of a particular power profile. The function is used to send an unsolicited command.

On receiving the notification on the client, the event `E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_STATE_NOTIFICATION` will be generated, containing the sent power profile information in a `tsCLD_PP_EnergyPhasesSchedulePayload` structure (see [Section 7.9.6](#)).

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of local endpoint on which cluster server resides
<i>u8DestinationEndPointId</i>	Number of remote endpoint on which cluster client resides
<i>psDestinationAddress</i>	Pointer to a structure containing the destination address of the client node
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>psPayload</i>	Pointer to structure containing the payload for the request (see Section 7.9.6), including the identifier of the relevant power profile and the associated schedule of energy phases

Returns

`E_ZCL_SUCCESS`
`E_ZCL_FAIL`
`E_ZCL_ERR_EP_UNKNOWN`
`E_ZCL_ERR_ZBUFFER_FAIL`
`E_ZCL_ERR_ZTRANSMIT_FAIL`

eCLD_PPPowerProfileScheduleConstraintsNotificationSend

```

teZCL_Status
eCLD_PPPowerProfileScheduleConstraintsNotificationSend(
    uint8 u8SourceEndPointId,
    uint8 u8DestinationEndPointId,
    tsZCL_Address *psDestinationAddress,
    uint8 *pu8TransactionSequenceNumber,
    tsCLD_PP_PowerProfileScheduleConstraintsPayload
                                     *psPayload);

```

Description

This function can be used on the cluster server to send a Power Profile Schedule Constraints Notification to a cluster client, in order to inform the client of the schedule restrictions on a particular power profile. The constraints are specified in a tsCLD_PP_PowerProfileScheduleConstraintsPayload structure (see [Section 7.9.7](#)). They can subsequently be used by the client in calculating the schedule for the energy phases of the power profile. The function is used to send an unsolicited command.

On receiving the notification on the client, the event E_CLD_PP_CMD_SCHEDULE_CONSTRAINTS_NOTIFICATION will be generated, containing the sent power profile constraint information in a tsCLD_PP_PowerProfileScheduleConstraintsPayload structure.

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of local endpoint on which cluster server resides
<i>u8DestinationEndPointId</i>	Number of remote endpoint on which cluster client resides
<i>psDestinationAddress</i>	Pointer to a structure containing the destination address of the client node
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>psPayload</i>	Pointer to structure containing the payload for the request (see Section 7.9.7), including the identifier of the relevant power profile and the associated schedule constraints

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_EP_UNKNOWN
E_ZCL_ERR_ZBUFFER_FAIL
E_ZCL_ERR_ZTRANSMIT_FAIL

eCLD_PP_EnergyPhasesScheduleReqSend

```
teZCL_Status eCLD_PP_EnergyPhasesScheduleReqSend(
    uint8 u8SourceEndPointId,
    uint8 u8DestinationEndPointId,
    tsZCL_Address *psDestinationAddress,
    uint8 *pu8TransactionSequenceNumber,
    tsCLD_PP_PowerProfileReqPayload *psPayload);
```

Description

This function can be used on the cluster server to send an Energy Phases Schedule Request to a cluster client, in order to obtain the schedule of energy phases for a particular power profile.

The function is non-blocking and will return immediately. On successfully receiving an Energy Phases Schedule Response from the client, an E_CLD_PP_CMD_ENERGY_PHASE_SCHEDULE_RSP event will be generated on the server, containing the requested schedule information in a tsCLD_PP_EnergyPhasesSchedulePayload structure (see [Section 7.9.6](#)). For full details of handling an Energy Phases Schedule Request, refer to [Section 7.4.4.1](#).

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of local endpoint on which cluster server resides
<i>u8DestinationEndPointId</i>	Number of remote endpoint on which cluster client resides
<i>psDestinationAddress</i>	Pointer to a structure containing the destination address of the client node
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>psPayload</i>	Pointer to structure containing the payload for the request (see Section 7.9.3), including the identifier of the relevant power profile

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_EP_UNKNOWN
E_ZCL_ERR_ZBUFFER_FAIL
E_ZCL_ERR_ZTRANSMIT_FAIL

eCLD_PPPowerProfileStateNotificationSend

```
teZCL_Status eCLD_PPPowerProfileStateNotificationSend(  
    uint8 u8SourceEndPointId,  
    uint8 u8DestinationEndPointId,  
    tsZCL_Address *psDestinationAddress,  
    uint8 *pu8TransactionSequenceNumber,  
    tsCLD_PP_PowerProfileStatePayload *psPayload);
```

Description

This function can be used on the cluster server to send a Power Profile State Notification to a cluster client, in order to inform the client of the state of the power profile that is currently active on the server. The function is used to send an unsolicited command.

On receiving the notification on the client, the event `E_CLD_PP_CMD_POWER_PROFILE_STATE_NOTIFICATION` will be generated, containing the sent power profile state information in a `tsCLD_PP_PowerProfileStatePayload` structure (see [Section 7.9.5](#)).

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of local endpoint on which cluster server resides
<i>u8DestinationEndPointId</i>	Number of remote endpoint on which cluster client resides
<i>psDestinationAddress</i>	Pointer to a structure containing the destination address of the client node
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>psPayload</i>	Pointer to structure containing the payload for the command (see Section 7.9.5), including the identifier and state of the relevant power profile

Returns

`E_ZCL_SUCCESS`
`E_ZCL_FAIL`
`E_ZCL_ERR_EP_UNKNOWN`
`E_ZCL_ERR_ZBUFFER_FAIL`
`E_ZCL_ERR_ZTRANSMIT_FAIL`

eCLD_PPGetPowerProfilePriceSend

```
teZCL_Status eCLD_PPGetPowerProfilePriceSend(
    uint8 u8SourceEndPointId,
    uint8 u8DestinationEndPointId,
    tsZCL_Address *psDestinationAddress,
    uint8 *pu8TransactionSequenceNumber,
    tsCLD_PP_PowerProfileReqPayload *psPayload);
```

Description

This function can be used on the cluster server to send a Get Power Profile Price Request to a cluster client, in order to request the cost of executing the schedule of a particular power profile. Use of this function must be enabled in the cluster compile-time options, as described in [Section 7.10](#).

The function is non-blocking and will return immediately. On successfully receiving a Get Power Profile Price Response from the client, an E_CLD_PP_CMD_GET_POWER_PROFILE_PRICE_RSP event will be generated on the server, containing the requested price information in a tsCLD_PP_GetPowerProfilePriceRspPayload structure (see [Section 7.9.9](#)). For full details of handling a Get Power Profile Price Request, refer to [Section 7.4.6.1](#).

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of local endpoint on which cluster server resides
<i>u8DestinationEndPointId</i>	Number of remote endpoint on which cluster client resides
<i>psDestinationAddress</i>	Pointer to a structure containing the destination address of the client node
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>psPayload</i>	Pointer to structure containing the payload for the request (see Section 7.9.5), including the identifier of the relevant power profile

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_EP_UNKNOWN
E_ZCL_ERR_ZBUFFER_FAIL
E_ZCL_ERR_ZTRANSMIT_FAIL

eCLD_PPGetPowerProfilePriceExtendedSend

```
teZCL_Status eCLD_PPGetPowerProfilePriceExtendedSend(  
    uint8 u8SourceEndPointId,  
    uint8 u8DestinationEndPointId,  
    tsZCL_Address *psDestinationAddress,  
    uint8 *pu8TransactionSequenceNumber,  
    tsCLD_PP_GetPowerProfilePriceExtendedPayload  
        *psPayload);
```

Description

This function can be used on the cluster server to send a Get Power Profile Price Extended Request to a cluster client, in order to request specific cost information about a power profile supported by the server. The cost of executing a power profile can be requested with either scheduled energy phases or contiguous energy phases (no gaps between them). Use of this function must be enabled in the cluster compile-time options, as described in [Section 7.10](#).

The function is non-blocking and will return immediately. On successfully receiving a Get Power Profile Price Extended Response from the client, an `E_CLD_PP_CMD_GET_POWER_PROFILE_PRICE_EXTENDED_RSP` event will be generated on the server, containing the requested price information in a `tsCLD_PP_GetPowerProfilePriceRspPayload` structure (see [Section 7.9.9](#)). For full details of handling a Get Power Profile Price Extended Request, refer to [Section 7.4.6.1](#).

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of local endpoint on which cluster server resides
<i>u8DestinationEndPointId</i>	Number of remote endpoint on which cluster client resides
<i>psDestinationAddress</i>	Pointer to a structure containing the destination address of the client node
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>psPayload</i>	Pointer to structure containing the payload for the request (see Section 7.9.8), including the type of price information required

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_EP_UNKNOWN
E_ZCL_ERR_ZBUFFER_FAIL
E_ZCL_ERR_ZTRANSMIT_FAIL

eCLD_PPGetOverallSchedulePriceSend

```
teZCL_Status eCLD_PPGetOverallSchedulePriceSend(  
    uint8 u8SourceEndPointId,  
    uint8 u8DestinationEndPointId,  
    tsZCL_Address *psDestinationAddress,  
    uint8 *pu8TransactionSequenceNumber);
```

Description

This function can be used on the cluster server to send a Get Overall Schedule Price Request to a cluster client, in order to obtain the overall cost of all the power profiles that will be executed over the next 24 hours. Use of this function must be enabled in the cluster compile-time options, as described in [Section 7.10](#).

The function is non-blocking and will return immediately. On successfully receiving a Get Overall Schedule Price Response from the client, an E_CLD_PP_CMD_GET_OVERALL_SCHEDULE_PRICE_RSP event will be generated on the server, containing the required price information in a tsCLD_PP_GetOverallSchedulePriceRspPayload structure (see [Section 7.9.10](#)). For full details of handling a Get Overall Schedule Price Request, refer to [Section 7.4.6.2](#).

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of local endpoint on which cluster server resides
<i>u8DestinationEndPointId</i>	Number of remote endpoint on which cluster client resides
<i>psDestinationAddress</i>	Pointer to a structure containing the destination address of the client node
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_EP_UNKNOWN
E_ZCL_ERR_ZBUFFER_FAIL
E_ZCL_ERR_ZTRANSMIT_FAIL

7.6.3 Client Functions

The following Power Profile cluster functions are provided in the HA API and can be used on a cluster client only:

Function	Page
eCLD_PPPowerProfileRequestSend	146
eCLD_PPEnergyPhasesScheduleNotificationSend	147
eCLD_PPPowerProfileStateReqSend	149
eCLD_PPEnergyPhasesScheduleStateReqSend	150
eCLD_PPPowerProfileScheduleConstraintsReqSend	151

eCLD_PPPowerProfileRequestSend

```
teZCL_Status eCLD_PPPowerProfileRequestSend(  
    uint8 u8SourceEndPointId,  
    uint8 u8DestinationEndPointId,  
    tsZCL_Address *psDestinationAddress,  
    uint8 *pu8TransactionSequenceNumber,  
    tsCLD_PP_PowerProfileReqPayload *psPayload);
```

Description

This function can be used on a cluster client to send a Power Profile Request to the cluster server, in order to obtain one or more power profiles from the server. The function can be used to request a specific power profile (specified using its identifier) or all the power profiles supported by the server (specified using an identifier of zero).

The function is non-blocking and will return immediately. On receiving the server's response, an E_CLD_PP_CMD_POWER_PROFILE_RSP event will be generated on the client, containing a power profile in a tsCLD_PP_PowerProfilePayload structure (see [Section 7.9.4](#)). If all power profiles on the server have been requested, a response will be received for each profile separately and, therefore, the above event will be generated for each profile reported.

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of local endpoint on which cluster client resides
<i>u8DestinationEndPointId</i>	Number of remote endpoint on which cluster server resides
<i>psDestinationAddress</i>	Pointer to a structure containing the destination address of the server node
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>psPayload</i>	Pointer to structure containing the payload for the request (see Section 7.9.3), including the identifier of the required power profile

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_EP_UNKNOWN
E_ZCL_ERR_ZBUFFER_FAIL
E_ZCL_ERR_ZTRANSMIT_FAIL

eCLD_PP_EnergyPhasesScheduleNotificationSend

```

teZCL_Status
eCLD_PP_EnergyPhasesScheduleNotificationSend(
    uint8 u8SourceEndPointId,
    uint8 u8DestinationEndPointId,
    tsZCL_Address *psDestinationAddress,
    uint8 *pu8TransactionSequenceNumber,
    tsCLD_PP_EnergyPhasesSchedulePayload
                                     *psPayload);

```

Description

This function can be used on a cluster client to send an Energy Phases Schedule Notification to the cluster server, in order to start the schedule of energy phases of a power profile on the server. The function is used to send an unsolicited command and should only be called if the server allows itself to be remotely controlled. The command payload specifies the identifiers of the required energy phases and includes the relative start-times of the phases (see [Section 7.9.12](#)).

On receiving the notification on the server, the event `E_CLD_PP_CMD_ENERGY_PHASE_SCHEDULE_NOTIFICATION` will be generated, containing the sent energy phase schedule information in a `tsCLD_PP_EnergyPhasesSchedulePayload` structure (see [Section 7.9.6](#)). The subsequent handling of this notification is detailed in [Section 7.4.4.2](#).

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of local endpoint on which cluster client resides
<i>u8DestinationEndPointId</i>	Number of remote endpoint on which cluster server resides
<i>psDestinationAddress</i>	Pointer to a structure containing the destination address of the server node
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>psPayload</i>	Pointer to structure containing the payload for the command (see Section 7.9.6), including the scheduled energy phases and start-times

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_EP_UNKNOWN
E_ZCL_ERR_ZBUFFER_FAIL
E_ZCL_ERR_ZTRANSMIT_FAIL

eCLD_PPPowerProfileStateReqSend

```
teZCL_Status eCLD_PPPowerProfileStateReqSend(
    uint8 u8SourceEndPointId,
    uint8 u8DestinationEndPointId,
    tsZCL_Address *psDestinationAddress,
    uint8 *pu8TransactionSequenceNumber);
```

Description

This function can be used on a cluster client to send a Power Profile State Request to the cluster server, in order to obtain the identifier(s) of the power profile(s) currently supported on the server.

The function is non-blocking and will return immediately. On receiving the server's response, an E_CLD_PP_CMD_POWER_PROFILE_STATE_RSP event will be generated on the client, containing the required identifier(s). The response will contain the power profile records of all the supported power profiles on the server in a tsCLD_PP_PowerProfileStatePayload structure (see [Section 7.9.5](#)).

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of local endpoint on which cluster client resides
<i>u8DestinationEndPointId</i>	Number of remote endpoint on which cluster server resides
<i>psDestinationAddress</i>	Pointer to a structure containing the destination address of the server node
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_EP_UNKNOWN
E_ZCL_ERR_ZBUFFER_FAIL
E_ZCL_ERR_ZTRANSMIT_FAIL

eCLD_PP_EnergyPhasesScheduleStateReqSend

```
teZCL_Status  
eCLD_PP_EnergyPhasesScheduleStateReqSend(  
    uint8 u8SourceEndPointId,  
    uint8 u8DestinationEndPointId,  
    tsZCL_Address *psDestinationAddress,  
    uint8 *pu8TransactionSequenceNumber,  
    tsCLD_PP_PowerProfileReqPayload *psPayload);
```

Description

This function can be used on a cluster client to send an Energy Phases Schedule State Request to the cluster server, in order to obtain the schedule of energy phases for a particular power profile on the server. The obtained schedule can be used to re-align the schedule information on the client with the information on the server - for example, after a reset of the client device.

The function is non-blocking and will return immediately. On receiving the server's response, an E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_STATE_RSP event will be generated on the client, containing the requested schedule information in a tsCLD_PP_EnergyPhasesSchedulePayload structure (see [Section 7.9.6](#)).

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of local endpoint on which cluster client resides
<i>u8DestinationEndPointId</i>	Number of remote endpoint on which cluster server resides
<i>psDestinationAddress</i>	Pointer to a structure containing the destination address of the server node
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>psPayload</i>	Pointer to structure containing the payload for the request (see Section 7.9.3), including the identifier of the relevant power profile

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_EP_UNKNOWN
E_ZCL_ERR_ZBUFFER_FAIL
E_ZCL_ERR_ZTRANSMIT_FAIL

eCLD_PPPowerProfileScheduleConstraintsReqSend

```
teZCL_Status
eCLD_PPPowerProfileScheduleConstraintsReqSend(
    uint8 u8SourceEndPointId,
    uint8 u8DestinationEndPointId,
    tsZCL_Address *psDestinationAddress,
    uint8 *pu8TransactionSequenceNumber,
    tsCLD_PP_PowerProfileReqPayload *psPayload);
```

Description

This function can be used on a cluster client to send a Power Profile Schedule Constraints Request to the cluster server, in order to obtain the schedule restrictions on a particular power profile on the server. The obtained constraints can subsequently be used in calculating a schedule of energy phases for the power profile (e.g. before calling **eCLD_PPEnergyPhasesScheduleNotificationSend()**).

The function is non-blocking and will return immediately. The server will send a response to this request and on receiving this response, an **E_CLD_PP_CMD_GET_POWER_PROFILE_SCHEDULE_CONSTRAINTS_RSP** event will be generated on the client, containing the requested schedule constraints in a **tsCLD_PP_PowerProfileScheduleConstraintsPayload** structure (see [Section 7.9.7](#)).

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of local endpoint on which cluster client resides
<i>u8DestinationEndPointId</i>	Number of remote endpoint on which cluster server resides
<i>psDestinationAddress</i>	Pointer to a structure containing the destination address of the server node
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>psPayload</i>	Pointer to structure containing the payload for the request (see Section 7.9.3), including the identifier of the relevant power profile

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_EP_UNKNOWN
E_ZCL_ERR_ZBUFFER_FAIL
E_ZCL_ERR_ZTRANSMIT_FAIL

7.7 Return Codes

The Power Profile cluster functions use the ZCL return codes defined in the *ZCL User Guide (JN-UG-3103)*.

7.8 Enumerations

7.8.1 'Attribute ID' Enumerations

The following structure contains the enumerations used to identify the attributes of the Power Profile cluster.

```
typedef enum PACK
{
    E_CLD_PP_ATTR_ID_TOTAL_PROFILE_NUM = 0x0000,
    E_CLD_PP_ATTR_ID_MULTIPLE_SCHEDULE,
    E_CLD_PP_ATTR_ID_ENERGY_FORMATTING,
    E_CLD_PP_ATTR_ID_ENERGY_REMOTE,
    E_CLD_PP_ATTR_ID_SCHEDULE_MODE
} teCLD_PP_Cluster_AttrID;
```

7.8.2 'Power Profile State' Enumerations

The following enumerations represent the possible states of a power profile.

```
typedef enum PACK
{
    E_CLD_PP_STATE_IDLE = 0x00,
    E_CLD_PP_STATE_PROGRAMMED,
    E_CLD_PP_STATE_RUNNING = 0x02,
    E_CLD_PP_STATE_PAUSED,
    E_CLD_PP_STATE_WAITING_TO_START,
    E_CLD_PP_STATE_WAITING_PAUSED,
    E_CLD_PP_STATE_ENDED,
} teCLD_PP_PowerProfileState;
```

The above enumerations are described in the table below.

Enumeration	Description
E_CLD_PP_STATE_IDLE	Not all parameters of the power profile have yet been defined
E_CLD_PP_STATE_PROGRAMMED	In the programmed state, as all the parameters of the power profile have been defined but there is no schedule or a schedule exists but has not been started
E_CLD_PP_STATE_RUNNING	The power profile is active and an energy phase is running
E_CLD_PP_STATE_PAUSED	The power profile is active but the current energy phase is paused
E_CLD_PP_STATE_WAITING_TO_START	The power profile is between two energy phases - one has ended and the next one has not yet started. If the next energy phase is the first energy phase of the schedule, this state indicates that schedule has been started but the first energy has not yet started
E_CLD_PP_STATE_WAITING_PAUSED	The power profile has been paused while in the 'waiting to start' state (described above)
E_CLD_PP_STATE_ENDED	The power profile schedule has finished

Table 55: 'Power Profile State' Enumerations

7.8.3 'Server-Generated Command' Enumerations

The following enumerations represent the commands that can be generated by the cluster server.

```
typedef enum PACK
{
    E_CLD_PP_CMD_POWER_PROFILE_NOTIFICATION = 0x00,
    E_CLD_PP_CMD_POWER_PROFILE_RSP,
    E_CLD_PP_CMD_POWER_PROFILE_STATE_RSP,
    E_CLD_PP_CMD_GET_POWER_PROFILE_PRICE,
    E_CLD_PP_CMD_POWER_PROFILE_STATE_NOTIFICATION,
    E_CLD_PP_CMD_GET_OVERALL_SCHEDULE_PRICE,
    E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_REQ,
    E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_STATE_RSP,
    E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_STATE_NOTIFICATION,
    E_CLD_PP_CMD_GET_POWER_PROFILE_SCHEDULE_CONSTRAINTS_NOTIFICATION,
    E_CLD_PP_CMD_GET_POWER_PROFILE_SCHEDULE_CONSTRAINTS_RSP,
    E_CLD_PP_CMD_GET_POWER_PROFILE_PRICE_EXTENDED
} teCLD_PP_ServerGeneratedCommandID;
```

The above enumerations are used to indicate types of Power Profile cluster events and are described in [Section 7.5](#).

7.8.4 'Server-Received Command' Enumerations

The following enumerations represent the commands that can be received by the cluster server (and are therefore generated on the cluster client).

```
typedef enum PACK
{
    E_CLD_PP_CMD_POWER_PROFILE_REQ = 0x00,
    E_CLD_PP_CMD_POWER_PROFILE_STATE_REQ,
    E_CLD_PP_CMD_GET_POWER_PROFILE_PRICE_RSP,
    E_CLD_PP_CMD_GET_OVERALL_SCHEDULE_PRICE_RSP,
    E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_NOTIFICATION,
    E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_RSP,
    E_CLD_PP_CMD_POWER_PROFILE_SCHEDULE_CONSTRAINTS_REQ,
    E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_STATE_REQ,
    E_CLD_PP_CMD_GET_POWER_PROFILE_PRICE_EXTENDED_RSP
} teCLD_PP_ServerReceivedCommandID;
```

The above enumerations are used to indicate types of Power Profile cluster events and are described in [Section 7.5](#).

7.9 Structures

7.9.1 tsCLD_PPCallbackMessage

For a Power Profile event, the `eEventType` field of the `tsZCL_CallbackEvent` structure is set to `E_ZCL_CBET_CLUSTER_CUSTOM`. This event structure also contains an element `sClusterCustomMessage`, which is itself a structure containing a field `pvCustomData`. This field is a pointer to the following `tsCLD_PPCallbackMessage` structure:

```
typedef struct
{
    uint8          u8CommandId;
#ifdef PP_CLIENT
    bool           bIsInfoAvailable;
#endif
    union
    {
        {
            tsCLD_PP_PowerProfileReqPayload *psPowerProfileReqPayload;
            tsCLD_PP_GetPowerProfilePriceExtendedPayload
                *psGetPowerProfilePriceExtendedPayload;

        } uReqMessage;
        union
        {
            tsCLD_PP_GetPowerProfilePriceRspPayload *psGetPowerProfilePriceRspPayload;
            tsCLD_PP_GetOverallSchedulePriceRspPayload
                *psGetOverallSchedulePriceRspPayload;

            tsCLD_PP_EnergyPhasesSchedulePayload *psEnergyPhasesSchedulePayload;
            tsCLD_PP_PowerProfileScheduleConstraintsPayload
                *psPowerProfileScheduleConstraintsPayload;

            tsCLD_PP_PowerProfilePayload *psPowerProfilePayload;
            tsCLD_PP_PowerProfileStatePayload *psPowerProfileStatePayload;
        } uRespMessage;
    }
} tsCLD_PPCallbackMessage;
```

where:

- `u8CommandId` indicates the type of Power Profile command that has been received, one of:
 - `E_CLD_PP_CMD_POWER_PROFILE_REQ`
 - `E_CLD_PP_CMD_POWER_PROFILE_STATE_REQ`
 - `E_CLD_PP_CMD_GET_POWER_PROFILE_PRICE_RSP`
 - `E_CLD_PP_CMD_GET_POWER_PROFILE_PRICE_EXTENDED_RSP`
 - `E_CLD_PP_CMD_GET_OVERALL_SCHEDULE_PRICE_RSP`
 - `E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_NOTIFICATION`
 - `E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_RSP`
 - `E_CLD_PP_CMD_GET_POWER_PROFILE_SCHEDULE_CONSTRAINTS_REQ`
 - `E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_STATE_REQ`
 - `E_CLD_PP_CMD_POWER_PROFILE_NOTIFICATION`
 - `E_CLD_PP_CMD_POWER_PROFILE_RSP`

- E_CLD_PP_CMD_POWER_PROFILE_STATE_RSP
- E_CLD_PP_CMD_POWER_PROFILE_STATE_NOTIFICATION
- E_CLD_PP_CMD_GET_POWER_PROFILE_PRICE
- E_CLD_PP_CMD_GET_OVERALL_SCHEDULE_PRICE
- E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_REQ
- E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_STATE_RSP
- E_CLD_PP_CMD_ENERGY_PHASES_SCHEDULE_STATE_NOTIFICATION
- E_CLD_PP_CMD_SCHEDULE_CONSTRAINTS_NOTIFICATION
- E_CLD_PP_CMD_GET_POWER_PROFILE_SCHEDULE_CONSTRAINTS_RSP
- E_CLD_PP_CMD_GET_POWER_PROFILE_PRICE_EXTENDED
- **bIsInfoAvailable** is a client-only boolean field which indicates whether the appropriate type of information (to which the event relates) is held on the client: TRUE if the information type is held on the client, FALSE otherwise
- **uReqMessage** is a union containing the command payload for a request, as one of (depending on the value of **u8CommandId**):
 - **psPowerProfileReqPayload** is a pointer to the payload of a Power Profile Request, a Get Power Profile Schedule Constraints Request, an Energy Phases Schedule Request, an Energy Phases Schedule State Request or a Get Power Profile Price Request (see [Section 7.9.5](#))
 - **psGetPowerProfilePriceExtendedPayload** is a pointer to the payload of a Get Power Profile Price Extended Request (see [Section 7.9.8](#))
- **uRespMessage** is a union containing the command payload for a response or notification, as one of (depending on the value of **u8CommandId**):
 - **psGetPowerProfilePriceRspPayload** is a pointer to the payload of a Get Power Profile Price Response or a Get Power Profile Price Extended Response (see [Section 7.9.9](#))
 - **psGetOverallSchedulePriceRspPayload** is a pointer to the payload of a Get Overall Schedule Price Response (see [Section 7.9.10](#))
 - **psEnergyPhasesSchedulePayload** is a pointer to the payload of an Energy Phases Schedule Response, an Energy Phases Schedule State Response, an Energy Phases Schedule Notification or an Energy Phases Schedule State Notification (see [Section 7.9.6](#))
 - **psPowerProfileScheduleConstraintsPayload** is a pointer to the payload of a Power Profile Schedule Constraints Response or a Power Profile Schedule Constraints Notification (see [Section 7.9.10](#))
 - **psPowerProfilePayload** is a pointer to the payload of a Power Profile Response or a Power Profile Notification (see [Section 7.9.4](#))
 - **psPowerProfileStatePayload** is a pointer to the payload of a Power Profile State Response or a Power Profile State Notification (see [Section 7.9.5](#))

Note: The command payload for each command type is indicated in [Table 53](#) and [Table 54](#) in [Section 7.5](#).

7.9.2 tsCLD_PPEntry

This structure contains the data for a power profile table entry.

```
typedef struct
{
    uint8_t    u8PowerProfileId;
    uint8_t    u8NumOfTransferredEnergyPhases;
    uint8_t    u8NumOfScheduledEnergyPhases;
    uint8_t    u8ActiveEnergyPhaseId;
    tsCLD_PP_EnergyPhaseDelay
        asEnergyPhaseDelay[CLD_PP_NUM_OF_ENERGY_PHASES];
    tsCLD_PP_EnergyPhaseInfo
        asEnergyPhaseInfo[CLD_PP_NUM_OF_ENERGY_PHASES];
    bool       bPowerProfileRemoteControl;
    uint8_t    u8PowerProfileState;
    uint16_t   ul6StartAfter;
    uint16_t   ul6StopBefore;
} tsCLD_PPEntry;
```

where:

- `u8PowerProfileId` is the identifier of the power profile in the range 1 to 255 (0 is reserved)
- `u8NumOfTransferredEnergyPhases` is the number of energy phases supported within the power profile
- `u8NumOfScheduledEnergyPhases` is the number of energy phases actually scheduled within the power profile (must be less than or equal to the value of `u8NumOfTransferredEnergyPhases`)
- `u8ActiveEnergyPhaseId` is the identifier of the energy phase that is currently active or will be active next (if currently between energy phases)
- `asEnergyPhaseDelay[]` is an array containing timing information on the scheduled energy phases, where each array element corresponds to one energy phase of the schedule (see [Section 7.9.12](#))
- `asEnergyPhaseInfo[]` is an array containing various information on the supported energy phases, where each array element corresponds to one energy phase of the profile (see [Section 7.9.11](#))

- `bPowerProfileRemoteControl` is a boolean indicating whether the power profile can be remotely controlled: TRUE if it can be remotely controlled, FALSE otherwise (this property directly affects the attribute `bEnergyRemote`)
- `u8PowerProfileState` is a value indicating the current state of the power profile (enumerations are provided - see [Section 7.8.2](#))
- `u16StartAfter` is the minimum time-delay, in minutes, to be implemented between an instruction to start the power profile schedule and actually starting the schedule
- `u16StopBefore` is the maximum time-delay, in minutes, to be implemented between an instruction to stop the power profile schedule and actually stopping the schedule

7.9.3 `tsCLD_PP_PowerProfileReqPayload`

This structure contains the payload of various power profile requests.

```
typedef struct
{
    uint8_t    u8PowerProfileId;
}tsCLD_PP_PowerProfileReqPayload;
```

where `u8PowerProfileId` is the identifier of the power profile of interest.

7.9.4 `tsCLD_PP_PowerProfilePayload`

This structure contains the payload of a Power Profile Response or of a Power Profile Notification, which reports the details of a power profile.

```
typedef struct
{
    uint8_t                u8TotalProfileNum;
    uint8_t                u8PowerProfileId;
    uint8_t                u8NumOfTransferredPhases;
    tsCLD_PP_EnergyPhaseInfo *psEnergyPhaseInfo;
}tsCLD_PP_PowerProfilePayload;
```

where:

- `u8TotalProfileNum` is the total number of power profiles supported on the originating device
- `u8PowerProfileId` is the identifier of the power profile being reported
- `u8NumOfTransferredPhases` is the number of energy phases supported within the power profile
- `psEnergyPhaseInfo` is a pointer to a structure or an array of structures (see [Section 7.9.11](#)) containing information on the supported energy phases, where each array element corresponds to one energy phase of the profile

7.9.5 tsCLD_PP_PowerProfileStatePayload

This structure contains the payload of a Power Profile State Response or of a Power Profile State Notification.

```
typedef struct
{
    uint8_t u8PowerProfileCount;
    tsCLD_PP_PowerProfileRecord *psPowerProfileRecord;
}tsCLD_PP_PowerProfileStatePayload;
```

where:

- `u8PowerProfileCount` is the number of power profiles in the payload
- `psPowerProfileRecord` is a pointer to one or more power profile records (see [Section 7.9.13](#)):
 - For a Power Profile State Notification, it is a pointer to the power profile record of the currently active power profile on the server
 - For a Power Profile State Response, it is a pointer to an array of power profile records for all the supported power profiles on the server

7.9.6 tsCLD_PP_EnergyPhasesSchedulePayload

This structure contains the payload of an Energy Phases Schedule Response, of an Energy Phases Schedule State Response or of an Energy Phases Schedule State Notification.

```
typedef struct
{
    uint8_t u8PowerProfileId;
    uint8_t u8NumOfScheduledPhases;
    tsCLD_PP_EnergyPhaseDelay *psEnergyPhaseDelay;
}tsCLD_PP_EnergyPhasesSchedulePayload;
```

where:

- `u8PowerProfileId` is the identifier of the power profile being reported
- `u8NumOfScheduledPhases` is the number of energy phases within the power profile schedule
- `psEnergyPhaseDelay` is a pointer to an array containing timing information on the scheduled energy phases, where each array element corresponds to one energy phase of the schedule (see [Section 7.9.12](#))

7.9.7 tsCLD_PP_PowerProfileScheduleConstraintsPayload

This structure contains the payload of a Power Profile Schedule Constraints Response or of a Power Profile Schedule Constraints Notification, which reports the schedule restrictions on a particular power profile.

```
typedef struct
{
    uint8_t    u8PowerProfileId;
    uint16_t   ul6StartAfter;
    uint16_t   ul6StopBefore;
} tsCLD_PP_PowerProfileScheduleConstraintsPayload;
```

where:

- u8PowerProfileId is the identifier of the power profile being reported
- ul6StartAfter is the minimum time-delay, in minutes, to be implemented between an instruction to start the power profile schedule and actually starting the schedule
- ul6StopBefore is the maximum time-delay, in minutes, to be implemented between an instruction to stop the power profile schedule and actually stopping the schedule

7.9.8 tsCLD_PP_GetPowerProfilePriceExtendedPayload

This structure contains the payload of a Get Power Profile Price Extended Request, which requests certain price information relating to a particular power profile.

```
typedef struct
{
    uint8_t    u8Options;
    uint8_t    u8PowerProfileId;
    uint16_t   ul6PowerProfileStartTime;
} tsCLD_PP_GetPowerProfilePriceExtendedPayload;
```

where:

- u8Options is a bitmap indicating the type of request:
 - If bit 0 is set to '1' then the ul6PowerProfileStartTime field is used, otherwise it is ignored
 - If bit 1 is set to '0' then an estimated price is required for contiguous energy phases (with no gaps between them); if bit 1 is set '1' then an estimated price is required for the energy phases as scheduled (with any scheduled gaps between them)
- u8PowerProfileId is the identifier of the power profile

- `u16PowerProfileStartTime` is an optional value (see `u8Options` above) which indicates the required start-time for execution of the power profile, in minutes, as measured from the current time

7.9.9 tsCLD_PP_GetPowerProfilePriceRspPayload

This structure contains the payload of a Get Power Profile Price Response, which is returned in reply to a Get Power Profile Price Request and a Get Power Profile Price Extended Request.

```
typedef struct
{
    uint8_t    u8PowerProfileId;
    uint16_t   u16Currency;
    uint32_t   u32Price;
    uint8_t    u8PriceTrailingDigits;
}tsCLD_PP_GetPowerProfilePriceRspPayload;
```

where:

- `u8PowerProfileId` is the identifier of the power profile
- `u16Currency` is a value representing the currency in which the price is quoted
- `u32Price` is the price as an integer value (without a decimal point)
- `u8PriceTrailingDigits` specifies the position of the decimal point in the price `u32Price`, by indicating the number of digits after the decimal point

7.9.10 tsCLD_PP_GetOverallSchedulePriceRspPayload

This structure contains the payload of a Energy Phases Schedule Response, which contains the overall cost of all the power profiles that will be executed over the next 24 hours.

```
typedef struct
{
    uint16_t   u16Currency;
    uint32_t   u32Price;
    uint8_t    u8PriceTrailingDigits;
}tsCLD_PP_GetOverallSchedulePriceRspPayload;
```

where:

- `u16Currency` is a value representing the currency in which the price is quoted
- `u32Price` represents the price as an integer value (without a decimal point)
- `u8PriceTrailingDigits` specifies the position of the decimal point in the price `u32Price`, by indicating the number of digits after the decimal point

7.9.11 tsCLD_PP_EnergyPhaseInfo

This structure contains various pieces of information about a specific energy phase of a power profile.

```
typedef struct
{
    zuint8    u8EnergyPhaseId;
    zuint8    u8MacroPhaseId;
    uint16_t  ul6ExpectedDuration;
    uint16_t  ul6PeakPower;
    uint16_t  ul6Energy;
    uint16_t  ul6MaxActivationDelay;
}tsCLD_PP_EnergyPhaseInfo;
```

where:

- `u8EnergyPhaseId` is the identifier of the energy phase
- `u8MacroPhaseId` is a value that may be used to obtain a name/label for the energy phase for display purposes - for example, it may be the index of an entry in a table of ASCII strings
- `ul6ExpectedDuration` is the expected duration of the energy phase, in minutes
- `ul6PeakPower` is the estimated peak power of the energy phase, in Watts
- `ul6Energy` is the estimated total energy consumption, in Joules, during the energy phase ($\leq \text{ul6PeakPower} \times \text{ul6ExpectedDuration} \times 60$)
- `ul6MaxActivationDelay` is the maximum delay, in minutes, between the end of the previous energy phase and the start of this energy phase - special values are as follows: 0x0000 if no delay possible, 0xFFFF if first energy phase

Note: If `ul6MaxActivationDelay` is non-zero, a delayed start-time for the energy phase can be set through the structure `tsCLD_PP_EnergyPhaseDelay` (see [Section 7.9.12](#)).

7.9.12 tsCLD_PP_EnergyPhaseDelay

This structure contains the start-time for a particular energy phase of a power profile.

```
typedef struct
{
    uint8_t    u8EnergyPhaseId;
    uint16_t   u16ScheduleTime;
} tsCLD_PP_EnergyPhaseDelay;
```

where:

- `u8EnergyPhaseId` is the identifier of the energy phase
- `u16ScheduleTime` is the start-time of the energy phase expressed as a delay, in minutes, from the end of the previous energy phase (for the first energy phase of a power profile schedule, this delay is measured from the start of the schedule)

Note: A delayed start-time for the energy phase can only be set through this structure if the field `u16MaxActivationDelay` of the structure `tsCLD_PP_EnergyPhaseInfo` for this energy phase is non-zero (see [Section 7.9.11](#)).

7.9.13 tsCLD_PP_PowerProfileRecord

This structure contains information about the current state of a power profile.

```
typedef struct
{
    uint8_t    u8PowerProfileId;
    uint8_t    u8EnergyPhaseId;
    bool       bPowerProfileRemoteControl;
    uint8_t    u8PowerProfileState;
} tsCLD_PP_PowerProfileRecord;
```

where:

- `u8PowerProfileId` is the identifier of the power profile
- `u8EnergyPhaseId` is the identifier of the currently running energy phase or, if currently between energy phases, the next energy phase to be run
- `bPowerProfileRemoteControl` is a boolean indicating whether the power profile can be remotely controlled (from a client device): TRUE if it can be remotely controlled, FALSE otherwise
- `u8PowerProfileState` is an enumeration indicating the current state of the power profile (see [Section 7.8.2](#))

7.9.14 tsCLD_PPCustomDataStructure

The Power Profile cluster requires extra storage space to be allocated to be used by internal functions. The structure definition for this storage is shown below:

```
typedef struct
{
#ifdef (CLD_PP) && (PP_SERVER)
    bool                                bOverrideRunning;
    uint8                              u8ActSchPhaseIndex;
    tsCLD_PPEntry asPowerProfileEntry[CLD_PP_NUM_OF_POWER_PROFILES];
#endif
    tsZCL_ReceiveEventAddress          sReceiveEventAddress;
    tsZCL_CallBackEvent                sCustomCallBackEvent;
    tsCLD_PPCallBackMessage            sCallBackMessage;
} tsCLD_PPCustomDataStructure;
```

The fields are for internal use and no knowledge of them is required.

7.10 Compile-Time Options

This section describes the compile-time options that may be configured in the **zcl_options.h** file of an application that uses the Power Profile cluster.

To enable the Power Profile cluster in the code to be built, it is necessary to add the following line to the file:

```
#define CLD_PP
```

In addition, to enable the cluster as a client or server, it is also necessary to add one of the following lines to the same file:

```
#define PP_SERVER
#define PP_CLIENT
```

The following options can also be configured at compile-time in the **zcl_options.h** file.

Enable 'Get Power Profile Price' Command

The optional 'Get Power Profile Price' command can be enabled by adding:

```
#define CLD_PP_CMD_GET_POWER_PROFILE_PRICE
```

Enable 'Get Power Profile Price Extended' Command

The optional 'Get Power Profile Price Extended' command can be enabled by adding:

```
#define CLD_PP_CMD_GET_POWER_PROFILE_PRICE_EXTENDED
```

Enable 'Get Overall Schedule Price' Command

The optional 'Get Overall Schedule Price' command can be enabled by adding:

```
#define CLD_PP_CMD_GET_OVERALL_SCHEDULE_PRICE
```

Number of Power Profiles

The number of power profiles on the local device can be defined as *n* by adding:

```
#define CLD_PP_NUM_OF_PROFILES n
```

In the current HA release, this value is fixed at 1 (only one power profile is allowed on a device).

Maximum Number of Energy Phases

The maximum number of energy phases in a power profile can be defined as *n* by adding:

```
#define CLD_PP_NUM_OF_ENERGY_PHASES n
```

By default, this value is 3.

Disable APS Acknowledgements for Bound Transmissions

APS acknowledgements for bound transmissions from this cluster can be disabled by adding:

```
#define CLD_PP_BOUND_TX_WITH_APS_ACK_DISABLED
```

8. Appliance Control Cluster

This chapter outlines the Appliance Control cluster which is defined in the ZigBee Home Automation profile, and provides an interface for remotely controlling appliances in the home.

The Appliance Control cluster has a Cluster ID of 0x001B.

8.1 Overview

The Appliance Control cluster provides an interface for the remote control and programming of home appliances (e.g. a washing machine) by sending basic operational commands such as start, pause, stop.

The cluster is enabled by defining `CLD_APPLIANCE_CONTROL` in the **zcl_options.h** file - see [Section 3.5.1](#). Further compile-time options for the Appliance Control cluster are detailed in [Section 8.9](#).

All attributes of the Appliance Control cluster are in the 'Appliance Functions' attribute set.

8.2 Cluster Structure and Attributes

The structure definition for the Appliance Control cluster (server) is:

```
typedef struct
{
    zuint16 ul6StartTime;
    zuint16 ul6FinishTime;

#ifdef CLD_APPLIANCE_CONTROL_REMAINING_TIME
    zuint16 ul6RemainingTime;
#endif

} tsCLD_ApplianceControl;
```

where:

- `ul6StartTime` is a bitmap representing the start-time of a 'running' cycle of the appliance, as follows:

Bits	Description
0-5	Minutes part of the start-time, in the range 0 to 59 (may be absolute or relative time - see below)
6-7	Type of time encoding: <ul style="list-style-type: none"> • 0x0: Relative time - start-time is a delay from the time that the attribute was set • 0x1: Absolute time - start-time is an actual time of the 24-hour clock • 0x2-0x3: Reserved The defaults are absolute time for ovens and relative time for other appliances.
8-15	Hours part of the start-time: <ul style="list-style-type: none"> • in the range 0 to 255, if relative time selected • in the range 0 to 23, if absolute time selected

- `ul6FinishTime` is a bitmap representing the stop-time of a 'running' cycle of the appliance, as follows:

Bits	Description
0-5	Minutes part of the stop-time, in the range 0 to 59 (may be absolute or relative time - see below)
6-7	Type of time encoding: <ul style="list-style-type: none"> • 0x0: Relative time - stop-time is a delay from the time that the attribute was set • 0x1: Absolute time - stop-time is an actual time of the 24-hour clock • 0x2-0x3: Reserved The defaults are absolute time for ovens and relative time for other appliances.
8-15	Hours part of the stop-time: <ul style="list-style-type: none"> • in the range 0 to 255, if relative time selected • in the range 0 to 23, if absolute time selected

- `ul6RemainingTime` is an optional attribute indicating the time, in minutes, remaining in the current 'running' cycle of the appliance (time until the end of the cycle) - this attribute is constantly updated during the running cycle and is zero when the appliance is not running

8.3 Sending Commands

The Appliance Control cluster server resides on the appliance to be controlled (e.g. a washing machine) and the cluster client resides on the controlling device (normally a remote control unit).

The commands from the client to the server can be of two types:

- 'Execution' commands, requesting appliance operations
- 'Status' commands, requesting appliance status information

In addition, status notification messages can be sent unsolicited from the server to the client.

Sending the above messages is described in the sub-sections below.

8.3.1 Execution Commands from Client to Server

An 'execution' command can be sent from the client to request that an operation is performed on the appliance (server) - the request is sent in an 'Execution of Command' message. The application on the client can send this message by calling the function **eCLD_ACExecutionOfCommandSend()**.

The possible operations depend on the target appliance but the following operations are available to be specified in the payload of the message (described in [Section 8.8.2](#)):

- Start appliance cycle
- Stop appliance cycle
- Pause appliance cycle
- Start superfreezing cycle
- Stop superfreezing cycle
- Start supercooling cycle
- Stop supercooling cycle
- Disable gas
- Enable gas

In the start and stop commands, the start-time and end-time can be specified. The commands are fully detailed in the British Standards document BS EN 50523.

The application on the server (appliance) will be notified of the received command by an E_CLD_APPLIANCE_CONTROL_CMD_EXECUTION_OF_COMMAND event (Appliance Control events are described in [Section 8.4](#)). The required command is specified in the payload of the message, which is contained in the above event. The application must then perform the requested command (if possible).

8.3.2 Status Commands from Client to Server

The application on the cluster client can request the current status of the appliance by sending a 'Signal State' message to the cluster server on the appliance. This message can be sent by calling the function **eCLD_ACSignalStateSend()**. This function returns immediately and the requested status information is later returned in an **E_CLD_APPLIANCE_CONTROL_CMD_SIGNAL_STATE_RESPONSE** event, which is generated when a response arrives from the server (Appliance Control events are described in [Section 8.4](#)).

Note: The cluster server handles the 'Signal State' message automatically and returns the requested status information in a 'Signal State Response' message to the client.

The appliance status information from the message payload is contained in the above event - for details of this payload and the status information, refer to [Section 8.8.3](#).

8.3.3 Status Notifications from Server to Client

The cluster server on the appliance can send unsolicited status notifications to the client in 'Signal State Notification' messages. A message of this kind can be sent by the application on the server by calling either of the following functions:

- **eCLD_ACSignalStateNotificationSend()**
- **eCLD_ACSignalStateResponseORSignalStateNotificationSend()**

Note: The latter function is also used internally by the cluster server to send a 'Signal State Response' message - see [Section 8.3.2](#).

The appliance status information from the 'Signal State Notification' message is reported to the application on the cluster client through the event **E_CLD_APPLIANCE_CONTROL_CMD_SIGNAL_STATE_NOTIFICATION**, which is generated when the notification arrives from the server (Appliance Control events are described in [Section 8.4](#)). The appliance status information from the message payload is contained in the above event - for details of this payload and the status information, refer to [Section 8.8.3](#).

8.4 Appliance Control Events

The Appliance Control cluster has its own events that are handled through the callback mechanism outlined in [Section 4.7](#) (and fully detailed in the *ZCL User Guide (JN-UG-3103)*). The cluster contains its own event handler. If a device uses this cluster then application-specific Appliance Control event handling must be included in the user-defined callback function for the associated endpoint, where this callback function is registered through the relevant endpoint registration function. This callback function will then be invoked when an Appliance Control event occurs and needs the attention of the application.

For an Appliance Control event, the `eEventType` field of the `tsZCL_CallbackEvent` structure is set to `E_ZCL_CBET_CLUSTER_CUSTOM`. This event structure also contains an element `sClusterCustomMessage`, which is itself a structure containing a field `pvCustomData`. This field is a pointer to the following `tsCLD_ApplianceControlCallbackMessage` structure:

```
typedef struct
{
    uint8    u8CommandId;
    bool     *pbApplianceStatusTwoPresent;
    union
    {
        tsCLD_AC_ExecutionOfCommandPayload *psExecutionOfCommandPayload;
        tsCLD_AC_SignalStateResponseORSignalStateNotificationPayload
            *psSignalStateResponseAndNotificationPayload;
    } uMessage;
} tsCLD_ApplianceControlCallbackMessage;
```

When an Appliance Control event occurs, one of four command types could have been received. The relevant command type is specified through the `u8CommandId` field of the `tsSM_CallbackMessage` structure. The possible command types are detailed the tables below for events generated on a server and a client.

u8CommandId Enumeration	Description
E_CLD_APPLIANCE_CONTROL_CMD_EXECUTION_OF_COMMAND	An 'Execution of Command' message has been received by the server (appliance), requesting an operation on the appliance
E_CLD_APPLIANCE_CONTROL_CMD_SIGNAL_STATE	A 'Signal State' message has been received by the server (appliance), requesting the status of the appliance

Table 56: Appliance Control Command Types (Events on Server)

u8CommandId Enumeration	Description
E_CLD_APPLIANCE_CONTROL_CMD_SIGNAL_STATE_RESPONSE	A response to a 'Signal State' message has been received by the client, containing the requested appliance status
E_CLD_APPLIANCE_CONTROL_CMD_SIGNAL_STATE_NOTIFICATION	A 'Signal State' notification message has been received by the client, containing unsolicited status information

Table 57: Appliance Control Command Types (Events on Client)

8.5 Functions

The following Appliance Control cluster functions are provided in the HA API:

Function	Page
eCLD_ApplianceControlCreateApplianceControl	173
eCLD_ACExecutionOfCommandSend	175
eCLD_ACSignalStateSend	177
eCLD_ACSignalStateResponseORSignalStateNotificationSend	178
eCLD_ACSignalStateNotificationSend	180
eCLD_ACChangeAttributeTime	182

eCLD_ApplianceControlCreateApplianceControl

```

teZCL_Status
eCLD_ApplianceControlCreateApplianceControl(
    tsZCL_ClusterInstance *psClusterInstance,
    bool_t blsServer,
    tsZCL_ClusterDefinition *psClusterDefinition,
    void *pvEndPointSharedStructPtr,
    uint8 *pu8AttributeControlBits,
    tsCLD_ApplianceControlCustomDataStructure
        *psCustomDataStructure);

```

Description

This function creates an instance of the Appliance Control cluster on an endpoint. The cluster instance is created on the endpoint which is associated with the supplied `tsZCL_ClusterInstance` structure and can act as a server or a client, as specified.

The function should only be called when setting up a custom endpoint containing one or more selected clusters (rather than the whole set of clusters supported by a standard ZigBee device). This function will create an Appliance Control cluster instance on the endpoint, but instances of other clusters may also be created on the same endpoint by calling their corresponding creation functions. For more details of creating cluster instances on custom endpoints, refer to [Appendix A](#).

Note: This function must not be called for an endpoint on which a standard ZigBee device will be used. In this case, the device and its supported clusters must be registered on the endpoint using the relevant device registration function from those described in [Chapter 13](#).

When used, this function must be the first Appliance Control cluster function called in the application, and must be called after the stack has been started and after the application profile has been initialised.

The function requires an array to be declared for internal use, which contains one element (of type `uint8`) for each attribute of the cluster. Since the Appliance Control cluster client has no attributes, this array is only required for the server. The array length is automatically adjusted by the compiler using the following declaration (for the cluster server):

```

uint8 au8ApplianceControlServerAttributeControlBits
[(sizeof(asCLD_ApplianceControlClusterAttributeDefinitions) /
sizeof(tsZCL_AttributeDefinition))];

```

Parameters

<i>psClusterInstance</i>	Pointer to structure containing information about the cluster instance to be created (see the <i>ZCL User Guide (JN-UG-3103)</i>). This structure will be updated by the function by initialising individual structure fields.
<i>bIsServer</i>	Type of cluster instance (server or client) to be created: TRUE - server FALSE - client
<i>psClusterDefinition</i>	Pointer to structure indicating the type of cluster to be created (see the <i>ZCL User Guide (JN-UG-3103)</i>). In this case, this structure must contain the details of the Appliance Control cluster. This parameter can refer to a pre-filled structure called <code>sCLD_ApplianceControl</code> which is provided in the ApplianceControl.h file.
<i>pvEndPointSharedStructPtr</i>	Pointer to the shared structure used for attribute storage. This parameter should be the address of the structure of type <code>tsCLD_ApplianceControl</code> which defines the attributes of Appliance Control cluster. The function will initialise the attributes with default values.
<i>pu8AttributeControlBits</i>	Pointer to an array of uint8 values, with one element for each attribute in the cluster (see above). For a cluster client, set this pointer to NULL.
<i>psCustomDataStructure</i>	Pointer to a structure containing the storage for internal functions of the cluster (see Section 8.8.4)

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_INVALID_VALUE

eCLD_ACExecutionOfCommandSend

```
teZCL_Status eCLD_ACExecutionOfCommandSend(
    uint8 u8SourceEndPointId,
    uint8 u8DestinationEndPointId,
    tsZCL_Address *psDestinationAddress,
    uint8 *pu8TransactionSequenceNumber,
    tsCLD_AC_ExecutionOfCommandPayload *psPayload);
```

Description

This function can be used on an Appliance Control cluster client to send an 'Execution of Command' message to a cluster server (appliance), where this message may specify one of the following control commands:

- Start appliance cycle
- Stop appliance cycle
- Pause appliance cycle
- Start superfreezing cycle
- Stop superfreezing cycle
- Start supercooling cycle
- Stop supercooling cycle
- Disable gas
- Enable gas

The required command is specified in the payload of the message (a pointer to this payload must be provided). The commands are fully detailed in the British Standards document BS EN 50523.

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameter

<i>u8SourceEndPointId</i>	Number of the local endpoint through which to send the message. This parameter is used both to send the message and to identify the instance of the shared structure holding the required attribute values
<i>u8DestinationEndPointId</i>	Number of the endpoint on the remote node to which the message will be sent. This parameter is ignored when sending to address types eZCL_AMBOUND and eZCL_AMGROUP
<i>psDestinationAddress</i>	Pointer to a structure holding the address of the node to which the request will be sent

Chapter 8

Appliance Control Cluster

<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>psPayload</i>	Pointer to a structure containing the payload for the message (see Section 8.8.2).

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_INVALID_VALUE

eCLD_ACSignalStateSend

```
teZCL_Status eCLD_ACSignalStateSend(
    uint8 u8SourceEndPointId,
    uint8 u8DestinationEndPointId,
    tsZCL_Address *psDestinationAddress,
    uint8 *pu8TransactionSequenceNumber);
```

Description

This function can be used on an Appliance Control cluster client to send a 'Signal State' message to a cluster server (appliance), which requests the status of the appliance. The function returns immediately and the requested status information is later returned in the following event, which is generated when a response is received from the server:

E_CLD_APPLIANCE_CONTROL_CMD_SIGNAL_STATE_RESPONSE

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of the local endpoint through which to send the message. This parameter is used both to send the message and to identify the instance of the shared structure holding the required attribute values
<i>u8DestinationEndPointId</i>	Number of the endpoint on the remote node to which the message will be sent. This parameter is ignored when sending to address types eZCL_AMBOUND and eZCL_AMGROUP
<i>psDestinationAddress</i>	Pointer to a structure holding the address of the node to which the message will be sent
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_INVALID_VALUE

eCLD_ACSignalStateResponseORSignalStateNotificationSend

```
teZCL_Status  
eCLD_ACSignalStateResponseORSignalStateNotificationSend(  
    uint8 u8SourceEndPointId,  
    uint8 u8DestinationEndPointId,  
    tsZCL_Address *psDestinationAddress,  
    uint8 *pu8TransactionSequenceNumber,  
    teCLD_ApplianceControl_ServerCommandId eCommandId,  
    bool bApplianceStatusTwoPresent,  
    tsCLD_AC_SignalStateResponseORSignalStateNotificationPayload  
        *psPayload);
```

Description

This function can be used on an Appliance Control cluster server to send a 'Signal State Response' message (in reply to a 'Signal State Request' message) or an unsolicited 'Signal State Notification' message to a cluster client.

The command to be sent must be specified as one of:

- E_CLD_APPLIANCE_CONTROL_CMD_SIGNAL_STATE_RESPONSE
- E_CLD_APPLIANCE_CONTROL_CMD_SIGNAL_STATE_NOTIFICATION

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of the local endpoint through which to send the message. This parameter is used both to send the message and to identify the instance of the shared structure holding the required attribute values
<i>u8DestinationEndPointId</i>	Number of the endpoint on the remote node to which the message will be sent. This parameter is ignored when sending to address types eZCL_AMBOUND and eZCL_AMGROUP
<i>psDestinationAddress</i>	Pointer to a structure holding the address of the node to which the message will be sent
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>eCommandId</i>	Enumeration indicating the command to be sent (see above and Section 8.7.3)

<i>bApplianceStatusTwoPresent</i>	Boolean indicating whether additional appliance status data is present in payload: TRUE - Present FALSE - Not present
<i>psPayload</i>	Pointer to structure containing payload for message (see above and Section 8.8.3)

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_INVALID_VALUE

eCLD_ACSignalStateNotificationSend

```
teZCL_Status eCLD_ACSignalStateNotificationSend(  
    uint8 u8SourceEndPointId,  
    uint8 u8DestinationEndPointId,  
    tsZCL_Address *psDestinationAddress,  
    uint8 *pu8TransactionSequenceNumber,  
    bool bApplianceStatusTwoPresent,  
    tsCLD_AC_SignalStateResponseORSignalStateNotificationPayload  
        *psPayload);
```

Description

This function can be used on an Appliance Control cluster server to send an unsolicited 'Signal State Notification' message to a cluster client. The function is an alternative to **eCLD_ACSignalStateResponseORSignalStateNotificationSend()**.

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of the local endpoint through which to send the message. This parameter is used both to send the message and to identify the instance of the shared structure holding the required attribute values
<i>u8DestinationEndPointId</i>	Number of the endpoint on the remote node to which the message will be sent. This parameter is ignored when sending to address types eZCL_AMBOUND and eZCL_AMGROUP
<i>psDestinationAddress</i>	Pointer to a structure holding the address of the node to which the message will be sent
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>bApplianceStatusTwoPresent</i>	Boolean indicating whether additional appliance status data is present in payload: TRUE - Present FALSE - Not present
<i>psPayload</i>	Pointer to structure containing payload for message (see above and Section 8.8.3)

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_INVALID_VALUE

eCLD_ACChangeAttributeTime

```
teZCL_Status eCLD_ACChangeAttributeTime(  
    uint8 u8SourceEndPointId,  
    teCLD_ApplianceControl_Cluster_AttrID eAttributeTimeId,  
    uint16 u16TimeValue);
```

Description

This function can be used on an Appliance Control cluster server (appliance) to update the time attributes of the cluster (start time, finish time, remaining time). This is particularly useful if the host node has its own timer.

The target attribute must be specified using one of:

- E_CLD_APPLIANCE_CONTROL_ATTR_ID_START_TIME
- E_CLD_APPLIANCE_CONTROL_ATTR_ID_FINISH_TIME
- E_CLD_APPLIANCE_CONTROL_ATTR_ID_REMAINING_TIME

Parameters

<i>u8SourceEndPointId</i>	Number of the local endpoint through which to send the message. This parameter is used both to send the message and to identify the instance of the shared structure holding the required attribute values
<i>eAttributeTimeId</i>	Identifier of attribute to be updated (see above and Section 8.8.1)
<i>u16TimeValue</i>	UTC time to set

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_INVALID_VALUE

8.6 Return Codes

The Appliance Control cluster functions use the ZCL return codes defined in the *ZCL User Guide (JN-UG-3103)*.

8.7 Enumerations

8.7.1 'Attribute ID' Enumerations

The following structure contains the enumerations used to identify the attributes of the Appliance Control cluster.

```
typedef enum PACK
{
    E_CLD_APPLIANCE_CONTROL_ATTR_ID_START_TIME = 0x0000,
    E_CLD_APPLIANCE_CONTROL_ATTR_ID_FINISH_TIME,
    E_CLD_APPLIANCE_CONTROL_ATTR_ID_REMAINING_TIME
} teCLD_ApplianceControl_Cluster_AttrID;
```

8.7.2 'Client Command ID' Enumerations

The following enumerations are used in commands issued on a cluster client.

```
typedef enum PACK
{
    E_CLD_APPLIANCE_CONTROL_CMD_EXECUTION_OF_COMMAND = 0x00,
    E_CLD_APPLIANCE_CONTROL_CMD_SIGNAL_STATE,
} teCLD_ApplianceControl_ClientCommandId;
```

The above enumerations are described in the table below.

Enumeration	Description
E_CLD_APPLIANCE_CONTROL_CMD_EXECUTION_OF_COMMAND	'Execution of Command' message
E_CLD_APPLIANCE_CONTROL_CMD_SIGNAL_STATE	'Signal State' message

Table 58: 'Client Command ID' Enumerations

8.7.3 'Server Command ID' Enumerations

The following enumerations are used in commands issued on a cluster server.

```
typedef enum PACK
{
    E_CLD_APPLIANCE_CONTROL_CMD_SIGNAL_STATE_RESPONSE = 0x00,
    E_CLD_APPLIANCE_CONTROL_CMD_SIGNAL_STATE_NOTIFICATION
} teCLD_ApplianceControl_ServerCommandId;
```

The above enumerations are described in the table below.

Enumeration	Description
E_CLD_APPLIANCE_CONTROL_CMD_SIGNAL_STATE_RESPONSE	A response to a 'Signal State' request
E_CLD_APPLIANCE_CONTROL_CMD_SIGNAL_STATE_NOTIFICATION	A 'Signal State' notification

Table 59: 'Server Command ID' Enumerations

8.8 Structures

8.8.1 tsCLD_ApplianceControlCallbackMessage

For an Appliance Control event, the `eEventType` field of the `tsZCL_CallbackEvent` structure is set to `E_ZCL_CBET_CLUSTER_CUSTOM`. This event structure also contains an element `sClusterCustomMessage`, which is itself a structure containing a field `pvcustomData`. This field is a pointer to the following `tsCLD_ApplianceControlCallbackMessage` structure:

```
typedef struct
{
    uint8    u8CommandId;
    bool     *pbApplianceStatusTwoPresent;
    union
    {
        tsCLD_AC_ExecutionOfCommandPayload *psExecutionOfCommandPayload;
        tsCLD_AC_SignalStateResponseORSignalStateNotificationPayload
            *psSignalStateResponseAndNotificationPayload;
    } uMessage;
} tsCLD_ApplianceControlCallbackMessage;
```

where:

- `u8CommandId` indicates the type of Appliance Control command that has been received, one of:
 - `E_CLD_APPLIANCE_CONTROL_CMD_EXECUTION_OF_COMMAND`
 - `E_CLD_APPLIANCE_CONTROL_CMD_SIGNAL_STATE`
 - `E_CLD_APPLIANCE_CONTROL_CMD_SIGNAL_STATE_RESPONSE`
 - `E_CLD_APPLIANCE_CONTROL_CMD_SIGNAL_STATE_NOTIFICATION`
- `pbApplianceStatusTwoPresent` is a pointer to a boolean indicating whether a second set of non-standard or proprietary status data is available:
 - `TRUE` - additional status data available
 - `FALSE` - additional status data unavailable
- `uMessage` is a union containing the command payload as one of (depending on the value of `u8CommandId`):
 - `psExecutionOfCommandPayload` is a pointer to the payload of an 'Execution of Command' message (see [Section 8.8.2](#))
 - `psSignalStateResponseAndNotificationPayload` is a pointer to the payload of a 'Signal State' response or notification message (see [Section 8.8.3](#))

8.8.2 tsCLD_AC_ExecutionOfCommandPayload

This structure contains the payload for an “Execution of Command” message.

```
typedef struct
{
    zenum8    eExecutionCommandId;
} tsCLD_AC_ExecutionOfCommandPayload;
```

where eExecutionCommandId is a value representing the command to be executed
- the commands are detailed in the British Standards document BS EN 50523.

8.8.3 tsCLD_AC_SignalStateResponseORSignalStateNotificationPayload

This structure contains the payload for a “Signal State” response or notification message.

```
typedef struct
{
    zenum8    eApplianceStatus;
    uint8     u8RemoteEnableFlagAndDeviceStatus;
    uint24    u24ApplianceStatusTwo;
} tsCLD_AC_SignalStateResponseORSignalStateNotificationPayload;
```

where:

- eApplianceStatus is a value indicating the reported appliance status (the relevant status values depend on the appliance):

Status Value	Description
0x00	Reserved
0x01	Appliance in off state
0x02	Appliance in stand-by
0x03	Appliance already programmed
0x04	Appliance already programmed and ready to start
0x05	Appliance is running
0x06	Appliance is in pause state
0x07	Appliance end programmed tasks
0x08	Appliance is in a failure state
0x09	Appliance programmed tasks have been interrupted
0x0A	Appliance in idle state
0x0B	Appliance rinse hold

Status Value	Description
0x0C	Appliance in service state
0x0D	Appliance in superfreezing state
0x0E	Appliance in supercooling state
0x0F	Appliance in superheating state
0x10-0x3F	Reserved
0x40-0x7F	Non-standardised
0x80-0xFF	Proprietary

- `u8RemoteEnableFlagAndDeviceStatus` is a bitmap value indicating the status of the relationship between the appliance and the remote control unit as well as the type of additional status information reported in `u24ApplianceStatusTwo`:

Bits	Field	Values/Description
0-3	Remote Enable Flags	Status of remote control link: <ul style="list-style-type: none"> • 0x0: Disabled • 0x1: Enabled remote and energy control • 0x2-0x06: Reserved • 0x7: Temporarily locked/disabled • 0x8-0xE: Reserved • 0xF: Enabled remote control
4-7	Device Status 2	Type of information in <code>u24ApplianceStatusTwo</code> : <ul style="list-style-type: none"> • 0x0: Proprietary • 0x1: Proprietary • 0x2: IRIS symptom code • 0x3-0xF: Reserved

- `u24ApplianceStatusTwo` is a value indicating non-standard or proprietary status information about the appliance. The type of status information represented by this value is indicated in the 'Device Status 2' field of `u8RemoteEnableFlagAndDeviceStatus`. In the case of an IRIS symptom code, the three bytes of this value represent a 3-digit code.

8.8.4 tsCLD_ApplianceControlCustomDataStructure

The Appliance Control cluster requires extra storage space to be allocated to be used by internal functions. The structure definition for this storage is shown below:

```
typedef struct
{
    tsZCL_ReceiveEventAddress      sReceiveEventAddress;
    tsZCL_CallBackEvent           sCustomCallBackEvent;
    tsCLD_ApplianceControlCallBackMessage sCallBackMessage;
} tsCLD_ApplianceControlCustomDataStructure;
```

The fields are for internal use and no knowledge of them is required.

8.9 Compile-Time Options

This section describes the compile-time options that may be enabled in the **zcl_options.h** file of an application that uses the Appliance Control cluster.

To enable the Appliance Control cluster in the code to be built, it is necessary to add the following line to the file:

```
#define CLD_APPLIANCE_CONTROL
```

In addition, to enable the cluster as a client or server, it is also necessary to add one of the following lines to the same file:

```
#define APPLIANCE_CONTROL_SERVER
#define APPLIANCE_CONTROL_CLIENT
```

The Appliance Control cluster has one optional attribute (see [Section 8.2](#)) which can be enabled using a macro that may be optionally specified at compile time by adding the following line to the **zcl_options.h** file:

```
#define CLD_APPLIANCE_CONTROL_REMAINING_TIME
```

9. Appliance Identification Cluster

This chapter outlines the Appliance Identification cluster which is defined in the ZigBee Home Automation profile, and provides an interface for obtaining and setting basic appliance information.

The Appliance Identification cluster has a Cluster ID of 0x0B00.

9.1 Overview

The Appliance Identification cluster provides an interface for obtaining and setting information about an appliance, such as product type and manufacturer.

The cluster is enabled by defining `CLD_APPLIANCE_IDENTIFICATION` in the **zcl_options.h** file - see [Section 3.5.1](#). Further compile-time options for the Appliance Identification cluster are detailed in [Section 9.6](#).

The information that can potentially be stored in this cluster is organised into the following attribute sets:

- Basic Appliance Identification
- Extended Appliance Identification

9.2 Cluster Structure and Attributes

The structure definition for the Appliance Identification cluster (server) is:

```
typedef struct
{
    zbmap56                                u64BasicIdentification;

#ifdef CLD_APPLIANCE_IDENTIFICATION_ATTR_COMPANY_NAME
    tsZCL_CharacterString    sCompanyName;
    uint8                    au8CompanyName[ 16 ];
#endif

#ifdef CLD_APPLIANCE_IDENTIFICATION_ATTR_COMPANY_ID
    zuint16                  u16CompanyId;
#endif

#ifdef CLD_APPLIANCE_IDENTIFICATION_ATTR_BRAND_NAME
    tsZCL_CharacterString    sBrandName;
    uint8                    au8BrandName[ 16 ];
#endif

#ifdef CLD_APPLIANCE_IDENTIFICATION_ATTR_BRAND_ID
```

Chapter 9

Appliance Identification Cluster

```
        uint16_t          ul6BrandId;
    #endif

    #ifdef CLD_APPLIANCE_IDENTIFICATION_ATTR_MODEL
        tsZCL_OctetString  sModel;
        uint8_t            au8Model[16];
    #endif

    #ifdef CLD_APPLIANCE_IDENTIFICATION_ATTR_PART_NUMBER
        tsZCL_OctetString  sPartNumber;
        uint8_t            au8PartNumber[16];
    #endif

    #ifdef CLD_APPLIANCE_IDENTIFICATION_ATTR_PRODUCT_REVISION
        tsZCL_OctetString  sProductRevision;
        uint8_t            au8ProductRevision[6];
    #endif

    #ifdef CLD_APPLIANCE_IDENTIFICATION_ATTR_SOFTWARE_REVISION
        tsZCL_OctetString  sSoftwareRevision;
        uint8_t            au8SoftwareRevision[6];
    #endif

    #ifdef CLD_APPLIANCE_IDENTIFICATION_ATTR_PRODUCT_TYPE_NAME
        tsZCL_OctetString  sProductTypeName;
        uint8_t            au8ProductTypeName[2];
    #endif

    #ifdef CLD_APPLIANCE_IDENTIFICATION_ATTR_PRODUCT_TYPE_ID
        uint16_t           ul6ProductTypeId;
    #endif

    #ifdef CLD_APPLIANCE_IDENTIFICATION_ATTR_CECED_SPEC_VERSION
        uint8_t            u8CECEDSpecificationVersion;
    #endif

} tsCLD_Applianceidentification;
```

where:

‘Basic Appliance Identification’ Attribute Set

- `u64BasicIdentification` is a mandatory attribute which is a 56-bit bitmap containing the following information about the appliance:

Bits	Information
0-15	Company (manufacturer) ID
16-31	Brand ID
32-47	Product Type ID, one of: <ul style="list-style-type: none"> • 0x0000: White Goods • 0x5601: Dishwasher • 0x5602: Tumble Dryer • 0x5603: Washer Dryer • 0x5604: Washing Machine • 0x5E03: Hob • 0x5E09: Induction Hob • 0x5E01: Oven • 0x5E06: Electrical Oven • 0x6601: Refrigerator/Freezer For enumerations, see Section 9.5.2 .
48-55	Specification Version

‘Extended Appliance Identification’ Attribute Set

- The following optional pair of attributes are used to store human readable versions of the company (manufacturer) name:
 - `sCompanyName` is a `tsZCL_OctetString` structure which contains a character string representing the company name of up to 16 characters
 - `au8CompanyName[16]` is a byte-array which contains the character data bytes representing the company name
- `u16CompanyId` is an optional attribute which contains the company ID
- The following optional pair of attributes are used to store human readable versions of the brand name:
 - `sBrandName` is a `tsZCL_OctetString` structure which contains a character string representing the brand name of up to 16 characters
 - `au8BrandName[16]` is a byte-array which contains the character data bytes representing the brand name
- `u16BrandId` is an optional attribute which contains the brand ID
- The following optional pair of attributes are used to store human readable versions of the manufacturer-defined model name:
 - `sModel` is a `tsZCL_OctetString` structure which contains a character string representing the model name of up to 16 characters

- `au8Model[16]` is a byte-array which contains the character data bytes representing the model name
- The following optional pair of attributes are used to store human readable versions of the manufacturer-defined part number/code:
 - `sPartNumber` is a `tsZCL_OctetString` structure which contains a character string representing the part number/code of up to 16 characters
 - `au8PartNumber[16]` is a byte-array which contains the character data bytes representing the part number/code
- The following optional pair of attributes are used to store human readable versions of the manufacturer-defined product revision number:
 - `sProductRevision` is a `tsZCL_OctetString` structure which contains a character string representing the product revision number of up to 6 characters
 - `au8ProductRevision[6]` is a byte-array which contains the character data bytes representing the product revision number
- The following optional pair of attributes are used to store human readable versions of the manufacturer-defined software revision number:
 - `sSoftwareRevision` is a `tsZCL_OctetString` structure which contains a character string representing the software revision number of up to 6 characters
 - `au8SoftwareRevision[6]` is a byte-array which contains the character data bytes representing the software revision number
- The following optional pair of attributes are used to store human readable versions of the 2-character product type name (e.g. “WM” for washing machine):
 - `sProductTypeName` is a `tsZCL_OctetString` structure which contains a character string representing the product type name of up to 2 characters
 - `au8ProductTypeName[2]` is a byte-array which contains the character data bytes representing the product type name
- `u16ProductTypeId` is an optional attribute containing the product type ID (from those listed above in the description of `u64BasicIdentification`)
- `u8CECEDSpecificationVersion` is an optional attribute which indicates the version of the CECED specification to which the appliance conforms, from the following:

Value	Specification
0x10	Compliant with v1.0, not certified
0x1A	Compliant with v1.0, certified
0xX0	Compliant with vX.0, not certified
0xXA	Compliant with vX.0, certified

9.3 Functions

The following Appliance Identification cluster function is provided in the HA API:

Function	Page
eCLD_ApplianceIdentificationCreateApplianceIdentification	194

Note: The attributes of this cluster can be accessed using the attribute read/write functions provided in the ZigBee Cluster Library and described in the *ZCL User Guide (JN-UG-3103)*.

eCLD_ApplianceIdentificationCreateApplianceIdentification

```
teZCL_Status  
eCLD_ApplianceIdentificationCreateApplianceIdentification(  
    tsZCL_ClusterInstance *psClusterInstance,  
    bool_t bIsServer,  
    tsZCL_ClusterDefinition *psClusterDefinition,  
    void *pvEndPointSharedStructPtr,  
    uint8 *pu8AttributeControlBits);
```

Description

This function creates an instance of the Appliance Identification cluster on an endpoint. The cluster instance is created on the endpoint which is associated with the supplied `tsZCL_ClusterInstance` structure and can act as a server or a client, as specified.

The function should only be called when setting up a custom endpoint containing one or more selected clusters (rather than the whole set of clusters supported by a standard ZigBee device). This function will create an Appliance Identification cluster instance on the endpoint, but instances of other clusters may also be created on the same endpoint by calling their corresponding creation functions. For more details of creating cluster instances on custom endpoints, refer to [Appendix A](#).

Note: This function must not be called for an endpoint on which a standard ZigBee device will be used. In this case, the device and its supported clusters must be registered on the endpoint using the relevant device registration function from those described in [Chapter 13](#).

When used, this function must be the first Appliance Identification cluster function called in the application, and must be called after the stack has been started and after the application profile has been initialised.

The function requires an array to be declared for internal use, which contains one element (of type `uint8`) for each attribute of the cluster. Since the Appliance Identification cluster client has no attributes, this array is only required for the server. The array length is automatically adjusted by the compiler using the following declaration (for the cluster server):

```
uint8 au8ApplianceIdentificationServerAttributeControlBits  
[(sizeof(asCLD_ApplianceIdentificationClusterAttributeDefinitions) /  
sizeof(tsZCL_AttributeDefinition))];
```

Parameters

<i>psClusterInstance</i>	Pointer to structure containing information about the cluster instance to be created (see the <i>ZCL User Guide (JN-UG-3103)</i>). This structure will be updated by the function by initialising individual structure fields.
<i>bIsServer</i>	Type of cluster instance (server or client) to be created: TRUE - server FALSE - client
<i>psClusterDefinition</i>	Pointer to structure indicating the type of cluster to be created (see the <i>ZCL User Guide (JN-UG-3103)</i>). In this case, this structure must contain the details of the Appliance Identification cluster. This parameter can refer to a pre-filled structure called <code>sCLD_ApplianceIdentification</code> which is provided in the ApplianceIdentification.h file.
<i>pvEndPointSharedStructPtr</i>	Pointer to the shared structure used for attribute storage. This parameter should be the address of the structure of the <code>tsCLD_ApplianceIdentification</code> type which defines the attributes of Appliance Identification cluster. The function will initialise the attributes with default values.
<i>pu8AttributeControlBits</i>	Pointer to an array of uint8 values, with one element for each attribute in the cluster (see above). For a cluster client, set this pointer to NULL.

Returns

E_ZCL_SUCCESS
 E_ZCL_FAIL
 E_ZCL_ERR_PARAMETER_NULL
 E_ZCL_ERR_INVALID_VALUE

9.4 Return Codes

The Appliance Identification cluster function uses the ZCL return codes defined in the *ZCL User Guide (JN-UG-3103)*.

9.5 Enumerations

9.5.1 'Attribute ID' Enumerations

The following structure contains the enumerations used to identify the attributes of the Appliance Identification cluster.

```
typedef enum PACK
{
    E_CLD_APPLIANCE_IDENTIFICATION_ATTR_ID_BASIC_IDENTIFICATION = 0x0000,
    E_CLD_APPLIANCE_IDENTIFICATION_ATTR_ID_COMPANY_NAME = 0x0010,
    E_CLD_APPLIANCE_IDENTIFICATION_ATTR_ID_COMPANY_ID,
    E_CLD_APPLIANCE_IDENTIFICATION_ATTR_ID_BRAND_NAME,
    E_CLD_APPLIANCE_IDENTIFICATION_ATTR_ID_BRAND_ID,
    E_CLD_APPLIANCE_IDENTIFICATION_ATTR_ID_MODEL,
    E_CLD_APPLIANCE_IDENTIFICATION_ATTR_ID_PART_NUMBER,
    E_CLD_APPLIANCE_IDENTIFICATION_ATTR_ID_PRODUCT_REVISION,
    E_CLD_APPLIANCE_IDENTIFICATION_ATTR_ID_SOFTWARE_REVISION,
    E_CLD_APPLIANCE_IDENTIFICATION_ATTR_ID_PRODUCT_TYPE_NAME,
    E_CLD_APPLIANCE_IDENTIFICATION_ATTR_ID_PRODUCT_TYPE_ID,
    E_CLD_APPLIANCE_IDENTIFICATION_ATTR_ID_CECED_SPEC_VERSION
} teCLD_ApplianceIdentification_Cluster_AttrID;
```

9.5.2 'Product Type ID' Enumerations

The following enumerations are used to represent the set of product type IDs.

```
typedef enum PACK
{
    E_CLD_AI_PT_ID_WHITE_GOODS = 0x0000,
    E_CLD_AI_PT_ID_DISHWASHER = 0x5601,
    E_CLD_AI_PT_ID_TUMBLE_DRYER,
    E_CLD_AI_PT_ID_WASHER_DRYER,
    E_CLD_AI_PT_ID_WASHING_MACHINE,
    E_CLD_AI_PT_ID_HOBS = 0x5E03,
    E_CLD_AI_PT_ID_INDUCTION_HOBS = 0x5E09,
    E_CLD_AI_PT_ID_OVEN = 0x5E01,
    E_CLD_AI_PT_ID_ELECTRICAL_OVEN = 0x5E06,
    E_CLD_AI_PT_ID_REFRIGERATOR_FREEZER = 0x6601
} teCLD_ApplianceIdentification_ProductTypeId;
```

9.6 Compile-Time Options

This section describes the compile-time options that may be enabled in the **zcl_options.h** file of an application that uses the Appliance Identification cluster.

To enable the Appliance Identification cluster in the code to be built, it is necessary to add the following line to the file:

```
#define CLD_APPLIANCE_IDENTIFICATION
```

In addition, to enable the cluster as a client or server, it is also necessary to add one of the following lines to the same file:

```
#define APPLIANCE_IDENTIFICATION_SERVER  
#define APPLIANCE_IDENTIFICATION_CLIENT
```

Optional Attributes

The optional attributes for the Appliance Identification cluster (see [Section 9.2](#)) are enabled by defining:

- CLD_APPLIANCE_IDENTIFICATION_ATTR_COMPANY_NAME
- CLD_APPLIANCE_IDENTIFICATION_ATTR_COMPANY_ID
- CLD_APPLIANCE_IDENTIFICATION_ATTR_BRAND_NAME
- CLD_APPLIANCE_IDENTIFICATION_ATTR_BRAND_ID
- CLD_APPLIANCE_IDENTIFICATION_ATTR_MODEL
- CLD_APPLIANCE_IDENTIFICATION_ATTR_PART_NUMBER

10. Appliance Events and Alerts Cluster

This chapter outlines the Appliance Events and Alerts cluster which is defined in the ZigBee Home Automation profile, and provides an interface for the notification of significant events and alert situations.

The Appliance Events and Alerts cluster has a Cluster ID of 0x0B02.

10.1 Overview

The Appliance Events and Alerts cluster provides an interface for sending notifications of appliance events (e.g. target temperature reached) and alerts (e.g. alarms).

The cluster is enabled by defining `CLD_APPLIANCE_EVENTS_AND_ALERTS` in the **zcl_options.h** file - see [Section 3.5.1](#). Further compile-time options for the Appliance Events and Alerts cluster are detailed in [Section 10.9](#).

Events are notified in terms of header and event identifier fields (an event may occur when the appliance reaches a certain state, such as the end of its operational cycle).

Alerts are notified in terms of the following fields:

- Alert identification value
- Alert category, one of: Warning, Danger, Failure
- Presence/recovery flag (indicating alert has been either detected or recovered)

10.2 Cluster Structure and Attributes

The Appliance Events and Alerts cluster has no attributes.

10.3 Sending Messages

The Appliance Events and Alerts cluster server resides on the appliance (e.g. a washing machine) and the cluster client resides on a controlling device (normally a remote control unit).

Messages can be sent between the client and the server in the following ways:

- Alerts that are active on the appliance can be requested by the client by sending a 'Get Alerts' message to the server (which will reply with a 'Get Alerts Response' message)
- Alerts that are active on the appliance can be sent unsolicited from the server to the client in an 'Alerts Notification' message
- The server can notify the client of an appliance event by sending an unsolicited 'Event Notification' message to the client

Sending the above messages is described in the sub-sections below.

10.3.1 'Get Alerts' Messages from Client to Server

The application on the cluster client can request the alerts that are currently active on the appliance by sending a 'Get Alerts' message to the server - this message is sent by calling the function **eCLD_AEAAGetAlertsSend()**. This function returns immediately and the requested alerts are later returned in an **E_CLD_APPLIANCE_EVENTS_AND_ALERTS_CMD_GET_ALERTS** event, which is generated when a response arrives from the server (Appliance Events and Alerts events are described in [Section 10.4](#)).

Note: The cluster server handles the 'Get Alerts' message automatically and returns the requested alerts in a 'Get Alerts Response' message to the client.

The appliance alerts from the message payload are contained in the above event - for details of this payload and the alert information, refer to [Section 10.8.2](#). Up to 15 alerts can be reported in a single response.

10.3.2 'Alerts Notification' Messages from Server to Client

The cluster server on the appliance can send unsolicited alert notifications to the client in 'Alerts Notification' messages. A message of this kind can be sent by the application on the server by calling either of the following functions:

- **eCLD_AEAAAlertsNotificationSend()**
- **eCLD_AEAAGetAlertsResponseORAlertsNotificationSend()**

Note: The latter function is also used internally by the cluster server to send a 'Get Alerts Response' message - see [Section 10.3.1](#).

The appliance status information from the 'Alerts Notification' message is reported to the application on the cluster client through the event **E_CLD_APPLIANCE_EVENTS_AND_ALERTS_CMD_ALERTS_NOTIFICATION**, which is generated when the notification arrives from the server (Appliance Events and Alerts events are described in [Section 10.4](#)). The appliance alerts from the message payload are contained in the above event - for details of this payload and the alert information, refer to [Section 10.8.2](#). Up to 15 alerts can be reported in a single notification.

10.3.3 'Event Notification' Messages from Server to Client

The cluster server on the appliance can send unsolicited event notifications to the client in 'Event Notification' messages, where each message reports a single appliance event (e.g. oven has reached its target temperature). A message of this kind can be sent by the application on the server by calling the function **eCLD_AEAAEventNotificationSend()**.

The appliance event information from the 'Event Notification' message is reported to the application on the cluster client through the event **E_CLD_APPLIANCE_EVENTS_AND_ALERTS_CMD_ALERTS_NOTIFICATION**, which is generated when the notification arrives from the server (Appliance Events and Alerts events are described in [Section 10.4](#)). The appliance event from the message payload is contained in the above client event - for details of this payload and the embedded appliance event information, refer to [Section 10.8.3](#).

10.4 Appliance Events and Alerts Events

The Appliance Events and Alerts cluster has its own events that are handled through the callback mechanism outlined in [Section 4.7](#) (and fully detailed in the *ZCL User Guide (JN-UG-3103)*). The cluster contains its own event handler. If a device uses this cluster then application-specific Appliance Events and Alerts event handling must be included in the user-defined callback function for the associated endpoint, where this callback function is registered through the relevant endpoint registration function. This callback function will then be invoked when an Appliance Events and Alerts event occurs and needs the attention of the application.

For an Appliance Events and Alerts event, the **eEventType** field of the **tsZCL_CallbackEvent** structure is set to **E_ZCL_CBET_CLUSTER_CUSTOM**. This event structure also contains an element **sClusterCustomMessage**, which is itself a structure containing a field **pvCustomData**. This field is a pointer to the following **tsCLD_ApplianceEventsAndAlertsCallBackMessage** structure:

```
typedef struct
{
    uint8      u8CommandId
    union
    {
        tsCLD_AEAA_GetAlertsResponseORAlertsNotificationPayload
                                *psGetAlertsResponseORAlertsNotificationPayload;

        tsCLD_AEAA_EventNotificationPayload
                                *psEventNotificationPayload;
    } uMessage;
} tsCLD_ApplianceEventsAndAlertsCallBackMessage;
```

When an Appliance Events and Alerts event occurs, one of four command types could have been received. The relevant command type is specified through the **u8CommandId** field of the **tsSM_CallbackMessage** structure. The possible

command types are detailed the tables below for events generated on a server and a client.

u8CommandId Enumeration	Description
E_CLD_APPLIANCE_EVENTS_AND_ALERTS_CMD_GET_ALERTS	A 'Get Alerts' request has been received by the server (appliance)

Table 60: Appliance Events and Alerts Command Types (Events on Server)

u8CommandId Enumeration	Description
E_CLD_APPLIANCE_EVENTS_AND_ALERTS_CMD_GET_ALERTS	A response to a 'Get Alerts' request has been received by the client, containing the requested alerts (up to 15)
E_CLD_APPLIANCE_EVENTS_AND_ALERTS_CMD_ALERTS_NOTIFICATION	An 'Alerts Notification' message has been received by the client, containing unsolicited alerts (up to 15)
E_CLD_APPLIANCE_EVENTS_AND_ALERTS_CMD_EVENT_NOTIFICATION	An 'Event Notification' message has been received by the client

Table 61: Appliance Events and Alerts Command Types (Events on Client)

10.5 Functions

The following Appliance Events and Alerts cluster functions are provided in the HA API:

Function	Page
eCLD_ApplianceEventsAndAlertsCreateApplianceEventsAndAlerts	203
eCLD_AEAAGetAlertsSend	205
eCLD_AEAAGetAlertsResponseORAlertsNotificationSend	206
eCLD_AEAAAlertsNotificationSend	208
eCLD_AEAAEventNotificationSend	209

eCLD_ApplianceEventsAndAlertsCreateApplianceEventsAndAlerts

```
teZCL_Status
eCLD_ApplianceEventsAndAlertsCreateApplianceEventsAndAlerts(
    tsZCL_ClusterInstance *psClusterInstance,
    bool_t blsServer,
    tsZCL_ClusterDefinition *psClusterDefinition,
    tsCLD_ApplianceEventsAndAlertsCustomDataStructure
        *psCustomDataStructure);
```

Description

This function creates an instance of the Appliance Events and Alerts cluster on an endpoint. The cluster instance is created on the endpoint which is associated with the supplied `tsZCL_ClusterInstance` structure and can act as a server or a client, as specified.

The function should only be called when setting up a custom endpoint containing one or more selected clusters (rather than the whole set of clusters supported by a standard ZigBee device). This function will create an Appliance Events and Alerts cluster instance on the endpoint, but instances of other clusters may also be created on the same endpoint by calling their corresponding creation functions. For more details of creating cluster instances on custom endpoints, refer to [Appendix A](#).

Note: This function must not be called for an endpoint on which a standard ZigBee device will be used. In this case, the device and its supported clusters must be registered on the endpoint using the relevant device registration function from those described in [Chapter 13](#).

When used, this function must be the first Appliance Events and Alerts cluster function called in the application, and must be called after the stack has been started and after the application profile has been initialised.

Parameters

<i>psClusterInstance</i>	Pointer to structure containing information about the cluster instance to be created (see the <i>ZCL User Guide (JN-UG-3103)</i>). This structure will be updated by the function by initialising individual structure fields.
<i>blsServer</i>	Type of cluster instance (server or client) to be created: TRUE - server FALSE - client
<i>psClusterDefinition</i>	Pointer to structure indicating the type of cluster to be created (see the <i>ZCL User Guide (JN-UG-3103)</i>). In this case, this structure must contain the details of the Appliance Events and Alerts cluster. This parameter can refer to a pre-filled structure called

Chapter 10

Appliance Events and Alerts Cluster

sCLD_ApplianceEventsAndAlerts which is provided in the **ApplianceEventsAndAlerts.h** file.

pvEndPointSharedStructPtr Pointer to the shared structure used for attribute storage. This parameter should be the address of the structure of *tsCLD_ApplianceEventsAndAlerts* type which defines the attributes of Appliance Events and Alerts cluster. The function will initialise the attributes with default values.

psCustomDataStructure Pointer to a structure containing the storage for internal functions of the cluster (see [Section 10.8.4](#))

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_INVALID_VALUE

eCLD_AEAAGetAlertsSend

```
teZCL_Status eCLD_AEAAGetAlertsSend(
    uint8 u8SourceEndPointId,
    uint8 u8DestinationEndPointId,
    tsZCL_Address *psDestinationAddress,
    uint8 *pu8TransactionSequenceNumber);
```

Description

This function can be used on an Appliance Events and Alerts cluster client to send a 'Get Alerts' message to a cluster server (appliance).

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameter

<i>u8SourceEndPointId</i>	Number of the local endpoint through which to send the message. This parameter is used both to send the message and to identify the instance of the shared structure holding the required attribute values
<i>u8DestinationEndPointId</i>	Number of the endpoint on the remote node to which the message will be sent. This parameter is ignored when sending to address types eZCL_AMBOUND and eZCL_AMGROUP
<i>psDestinationAddress</i>	Pointer to a structure holding the address of the node to which the request will be sent
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_INVALID_VALUE

eCLD_AEAAGetAlertsResponseORAlertsNotificationSend

```
teZCL_Status  
eCLD_AEAAGetAlertsResponseORAlertsNotificationSend(  
    uint8 u8SourceEndPointId,  
    uint8 u8DestinationEndPointId,  
    tsZCL_Address *psDestinationAddress,  
    uint8 *pu8TransactionSequenceNumber,  
    teCLD_ApplianceEventsAndAlerts_CommandId eCommandId,  
    tsCLD_AEAA_GetAlertsResponseORAlertsNotificationPayload  
        *psPayload);
```

Description

This function can be used on an Appliance Events and Alerts cluster server to send a 'Get Alerts Response' message (in reply to a 'Get Alerts' message) or an unsolicited 'Alerts Notification' message to a cluster client.

The command to be sent must be specified as one of:

- E_CLD_APPLIANCE_EVENTS_AND_ALERTS_CMD_GET_ALERTS
- E_CLD_APPLIANCE_EVENTS_AND_ALERTS_CMD_ALERTS_NOTIFICATION

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of the local endpoint through which to send the message. This parameter is used both to send the message and to identify the instance of the shared structure holding the required attribute values
<i>u8DestinationEndPointId</i>	Number of the endpoint on the remote node to which the message will be sent. This parameter is ignored when sending to address types eZCL_AMBOUND and eZCL_AMGROUP
<i>psDestinationAddress</i>	Pointer to a structure holding the address of the node to which the message will be sent
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>eCommandId</i>	Enumeration indicating the command to be sent (see above and Section 10.7.1)
<i>psPayload</i>	Pointer to structure containing payload for message (see Section 10.8.2)

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_INVALID_VALUE

eCLD_AEAAAlertsNotificationSend

```
teZCL_Status eCLD_AEAAAlertsNotificationSend(  
    uint8 u8SourceEndPointId,  
    uint8 u8DestinationEndPointId,  
    tsZCL_Address *psDestinationAddress,  
    uint8 *pu8TransactionSequenceNumber,  
    tsCLD_AEAA_GetAlertsResponseORAlertsNotificationPayload  
        *psPayload);
```

Description

This function can be used on an Appliance Events and Alerts cluster server to send an unsolicited 'Alerts Notification' message to a cluster client. The function is an alternative to **eCLD_AEAAGetAlertsResponseORAlertsNotificationSend()**.

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of the local endpoint through which to send the message. This parameter is used both to send the message and to identify the instance of the shared structure holding the required attribute values
<i>u8DestinationEndPointId</i>	Number of the endpoint on the remote node to which the message will be sent. This parameter is ignored when sending to address types eZCL_AMBOUND and eZCL_AMGROUP
<i>psDestinationAddress</i>	Pointer to a structure holding the address of the node to which the message will be sent
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>psPayload</i>	Pointer to structure containing payload for message (see Section 10.8.2)

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_INVALID_VALUE

eCLD_AEAAEventNotificationSend

```
teZCL_Status eCLD_AEAAEventNotificationSend(
    uint8 u8SourceEndPointId,
    uint8 u8DestinationEndPointId,
    tsZCL_Address *psDestinationAddress,
    uint8 *pu8TransactionSequenceNumber,
    tsCLD_AEAA_EventNotificationPayload *psPayload);
```

Description

This function can be used on an Appliance Events and Alerts cluster server (appliance) to send an 'Event Notification' message to a cluster client, to indicate that an incident has occurred.

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of the local endpoint through which to send the message. This parameter is used both to send the message and to identify the instance of the shared structure holding the required attribute values
<i>u8DestinationEndPointId</i>	Number of the endpoint on the remote node to which the message will be sent. This parameter is ignored when sending to address types eZCL_AMBOUND and eZCL_AMGROUP
<i>psDestinationAddress</i>	Pointer to a structure holding the address of the node to which the message will be sent
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>psPayload</i>	Pointer to structure containing payload for message (see Section 10.8.3)

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_INVALID_VALUE

10.6 Return Codes

The Appliance Events and Alerts cluster functions use the ZCL return codes defined in the *ZCL User Guide (JN-UG-3103)*.

10.7 Enumerations

10.7.1 'Command ID' Enumerations

The following enumerations are used in commands received on a cluster server or client.

```
typedef enum PACK
{
    E_CLD_APPLIANCE_EVENTS_AND_ALERTS_CMD_GET_ALERTS = 0x00,
    E_CLD_APPLIANCE_EVENTS_AND_ALERTS_CMD_ALERTS_NOTIFICATION,
    E_CLD_APPLIANCE_EVENTS_AND_ALERTS_CMD_EVENT_NOTIFICATION
} teCLD_ApplianceEventsAndAlerts_CommandId;
```

The above enumerations are described in the table below.

Enumeration	Description
E_CLD_APPLIANCE_EVENTS_AND_ALERTS_CMD_GET_ALERTS	'Get Alerts' request (on server) or response (on client)
E_CLD_APPLIANCE_EVENTS_AND_ALERTS_CMD_ALERTS_NOTIFICATION	Alerts notification (on client)
E_CLD_APPLIANCE_EVENTS_AND_ALERTS_CMD_EVENT_NOTIFICATION	Events notification (on server)

Table 62: 'Command ID' Enumerations

10.8 Structures

10.8.1 tsCLD_ApplianceEventsAndAlertsCallBackMessage

For an Appliance Events and Alerts event, the `eEventType` field of the `tsZCL_CallBackEvent` structure is set to `E_ZCL_CBET_CLUSTER_CUSTOM`. This event structure also contains an element `sClusterCustomMessage`, which is itself a structure containing a field `pvCustomData`. This field is a pointer to the following `tsCLD_ApplianceEventsAndAlertsCallBackMessage` structure:

```
typedef struct
{
    uint8      u8CommandId
    union
    {
        tsCLD_AEAA_GetAlertsResponseORAlertsNotificationPayload
                                *psGetAlertsResponseORAlertsNotificationPayload;
        tsCLD_AEAA_EventNotificationPayload
                                *psEventNotificationPayload;
    } uMessage;
} tsCLD_ApplianceEventsAndAlertsCallBackMessage;
```

where:

- `u8CommandId` indicates the type of Appliance Events and Alerts command that has been received, one of:
 - `E_CLD_APPLIANCE_EVENTS_AND_ALERTS_CMD_GET_ALERTS`
 - `E_CLD_APPLIANCE_EVENTS_AND_ALERTS_CMD_ALERTS_NOTIFICATION`
 - `E_CLD_APPLIANCE_EVENTS_AND_ALERTS_CMD_EVENT_NOTIFICATION`
- `uMessage` is a union containing the command payload as one of (depending on the value of `u8CommandId`):
 - `psGetAlertsResponseORAlertsNotificationPayload` is a pointer to the payload of an “Get Alerts” response message or an alerts notification message (see [Section 10.8.2](#))
 - `psEventNotificationPayload` is a pointer to the payload of an events notification message (see [Section 10.8.3](#))

10.8.2 tsCLD_AEAA_GetAlertsResponseORAlertsNotificationPayload

This structure contains the payload for a 'Get Alerts Response' message or an 'Alerts Notification' message.

```
typedef struct
{
    uint8_t u8AlertsCount;
    uint24_t au24AlertStructure[
        CLD_APPLIANCE_EVENTS_AND_ALERTS_MAXIMUM_NUM_OF_ALERTS];
} tsCLD_AEAA_GetAlertsResponseORAlertsNotificationPayload;
```

where:

- u8AlertsCount is an 8-bit bitmap containing the following alerts information:

Bits	Description
0-3	Number of reported alerts
4-7	Type of alert: <ul style="list-style-type: none">• 0x0: Unstructured• 0x1-0xF: Reserved

- au24AlertStructure[] is an array of 24-bit bitmaps, with one bitmap for each reported alert, containing the following information:

Bits	Description
0-7	Alert ID: <ul style="list-style-type: none">• 0x0: Reserved• 0x01-0x3F: Standardised• 0x40-0x7F: Non-standardised• 0x80-0xFF: Proprietary
8-11	Category: <ul style="list-style-type: none">• 0x0: Reserved• 0x1: Warning• 0x2: Danger• 0x3: Failure• 0x4-0xF: Reserved
12-13	Presence or recovery: <ul style="list-style-type: none">• 0x0: Presence (alert detected)• 0x1: Recovery (alert recovered)• 0x2-0x3: Reserved
14-15	Reserved (set to 0x0)
16-23	Non-standardised or proprietary

10.8.3 tsCLD_AEAA_EventNotificationPayload

This structure contains the payload for an 'Event Notification' message.

```
typedef struct
{
    uint8_t u8EventHeader;
    uint8_t u8EventIdentification;
} tsCLD_AEAA_EventNotificationPayload;
```

where:

- u8EventHeader is reserved and set to 0
- u8EventIdentification is the identifier of the event being notified:
 - 0x01: End of operational cycle reached
 - 0x02: Reserved
 - 0x03: Reserved
 - 0x04: Target temperature reached
 - 0x05: End of cooking process reached
 - 0x06: Switching off
 - 0xF7: Wrong data

(Values 0x00 to 0x3F are standardised, 0x40 to 0x7F are non-standardised, and 0x80 to 0xFF except 0xF7 are proprietary)

10.8.4 tsCLD_ApplianceEventsAndAlertsCustomDataStructure

The Appliance Events and Alerts cluster requires extra storage space to be allocated to be used by internal functions. The structure definition for this storage is shown below:

```
typedef struct
{
    tsZCL_ReceiveEventAddress sReceiveEventAddress;
    tsZCL_CallBackEvent sCustomCallBackEvent;
    tsCLD_ApplianceEventsAndAlertsCallBackMessage sCallBackMessage;
} tsCLD_ApplianceEventsAndAlertsCustomDataStructure;
```

The fields are for internal use and no knowledge of them is required.

10.9 Compile-Time Options

This section describes the compile-time options that may be enabled in the **zcl_options.h** file of an application that uses the Appliance Events and Alerts cluster.

To enable the Appliance Events and Alerts cluster in the code to be built, it is necessary to add the following line to the file:

```
#define CLD_APPLIANCE_EVENTS_AND_ALERTS
```

In addition, to enable the cluster as a client or server, it is also necessary to add one of the following lines to the same file:

```
#define APPLIANCE_EVENTS_AND_ALERTS_SERVER  
#define APPLIANCE_EVENTS_AND_ALERTS_CLIENT
```

Maximum Number of Alerts Reported

The maximum number of alerts that can be reported in a response or notification can be defined (as *n*) using the following definition in the **zcl_options.h** file:

```
#define CLD_APPLIANCE_EVENTS_AND_ALERTS_MAXIMUM_NUM_OF_ALERTS n
```

The default value is 16, which is the upper limit on this value, and *n* must therefore not be greater than 16.

11. Appliance Statistics Cluster

This chapter outlines the Appliance Statistics cluster which is defined in the ZigBee Home Automation profile, and provides an interface for supplying statistical information about an appliance.

The Appliance Statistics cluster has a Cluster ID of 0x0B03.

11.1 Overview

The Appliance Statistics cluster provides an interface for sending appliance statistics in the form of data logs to a collector node, which may be a gateway.

The cluster is enabled by defining `CLD_APPLIANCE_STATISTICS` in the **zcl_options.h** file - see [Section 3.5.1](#). Further compile-time options for the Appliance Statistics cluster are detailed in [Section 11.10](#).

The cluster client may obtain logs from the server (appliance) in any of the following ways:

- Unsolicited log notifications sent by the server
- Solicited responses obtained by:
 - Client sending 'Log Queue Request' to enquire whether logs are available
 - Client sending 'Log Request' for each log available
- Semi-solicited responses obtained by:
 - Server sending 'Statistics Available' notification to indicate that logs are available
 - Client sending 'Log Request' for each log available

11.2 Cluster Structure and Attributes

The structure definition for the Appliance Statistics cluster (server) is:

```
typedef struct
{
    uint32_t      u32LogMaxSize;
    uint8_t       u8LogQueueMaxSize;
}tsCLD_ApplianceStatistics;
```

where:

- `u32LogMaxSize` is a mandatory attribute which specifies the maximum size, in bytes, of the payload of a log notification and log response. This value should not be greater than 70 bytes (otherwise the Partition cluster is needed)
- `u8LogQueueMaxSize` is a mandatory attribute which specifies the maximum number of logs in the queue on the cluster server that are available to be requested by the client

11.3 Sending Messages

The Appliance Statistics cluster server resides on the appliance (e.g. a washing machine) and the cluster client resides on a controlling device (normally a remote control unit).

Messages can be sent between the client and the server in the following ways:

- The client can enquire whether any data logs are available on the appliance (server) by sending a 'Log Queue Request' to the server (which will reply with a 'Log Queue Response' message)
- The server can notify the client that data logs are available by sending an unsolicited 'Statistics Available' message to the client
- The client can request a current data log from the appliance (server) by sending a 'Log Request' message to the server (which will reply with a 'Log Response' message)
- The server can send an unsolicited data log to the client in a 'Log Notification' message

Sending the above messages is described in the sub-sections below.

11.3.1 'Log Queue Request' Messages from Client to Server

The application on the cluster client can enquire about the availability of data logs on the appliance by sending a 'Log Queue Request' message to the server. This message is sent by calling the function **eCLD_ASCLogQueueRequestSend()**. This function returns immediately and the log availability is later returned in an **E_CLD_APPLIANCE_STATISTICS_CMD_LOG_QUEUE_RESPONSE** event, which is generated when a response arrives from the server (Appliance Statistics events are described in [Section 11.5](#)).

Note: The cluster server handles the 'Log Queue Request' message automatically and returns the requested information in a 'Log Queue Response' message to the client.

The log availability information from the message payload is contained in the above event, and comprises the number of logs currently in the log queue and their log IDs - for details of this payload and the availability information, refer to [Section 11.9.4](#).

11.3.2 'Statistics Available' Messages from Server to Client

The cluster server can notify the client when data logs are available by sending an unsolicited 'Statistics Available' message to the client. This message contains the number of logs in the log queue and the log IDs. A message of this kind can be sent by the application on the server by calling either of the following functions:

- **eCLD_ASCStatisticsAvailableSend()**
- **eCLD_ASCLogQueueResponseORStatisticsAvailableSend()**

Note 1: The latter function is also used internally by the cluster server to send a 'Log Queue Response' message - see [Section 11.3.1](#).

Note 2: Before calling either function, the relevant log(s) should be added to the local log queue as described in [Section 11.4.1](#). This is because the logs need to be in the queue to allow the server to perform further actions on them - for example, to process a 'Log Request'.

The log availability information from the 'Statistics Available' message is reported to the application on the cluster client through the event **E_CLD_APPLIANCE_STATISTICS_CMD_STATISTICS_AVAILABLE**, which is generated when the message arrives from the server (Appliance Statistics events are described in [Section 11.5](#)). The availability information from the message payload is contained in the above event - for details of this payload and the availability information, refer to [Section 11.9.4](#).

11.3.3 'Log Request' Messages from Client to Server

The application on the cluster client can request the log with a particular log ID from the appliance by sending a 'Log Request' message to the server. This message is sent by calling the function **eCLD_ASCLogRequestSend()**. This function returns immediately and the requested log information is later returned in an **E_CLD_APPLIANCE_STATISTICS_CMD_LOG_QUEUE_RESPONSE** event, which is generated when a response arrives from the server (Appliance Statistics events are described in [Section 11.5](#)).

Note 1: This function should normally be called after a 'Log Queue Response' or 'Statistics Available' message has been received by the client, indicating that logs are available on the server.

Note 2: The cluster server handles the 'Log Request' message automatically and returns the requested log information in a 'Log Response' message to the client.

The log information from the message payload is contained in the above event - for details of this payload and the supplied log information, refer to [Section 11.9.3](#).

11.3.4 'Log Notification' Messages from Server to Client

The cluster server can supply the client with an individual data log by sending an unsolicited 'Log Notification' message to the client. This message is sent by the application on the server by calling either of the following functions:

- **eCLD_ASCLogNotificationSend()**
- **eCLD_ASCLogNotificationORLogResponseSend()**

Note 1: The latter function is also used internally by the cluster server to send a 'Log Response' message - see [Section 11.3.1](#).

Note 2: Before calling either function, the relevant log should be in the local log queue (see [Section 11.4.1](#)). This is because the log needs to be in the queue to allow the server to perform further actions on it - for example, to process a 'Log Request'.

Note 3: The function **eCLD_ASCAddLog()** used to add a log to the local log queue (see [Section 11.4.1](#)) automatically sends a 'Log Notification' message to all bound Appliance Statistics cluster clients.

The log information from the 'Log Notification' message is reported to the application on the cluster client through the event `E_CLD_APPLIANCE_STATISTICS_CMD_LOG_NOTIFICATION`, which is generated when the message arrives from the server (Appliance Statistics events are described in [Section 11.5](#)). The log information from the message payload is contained in the above event - for details of this payload and the supplied log information, refer to [Section 11.9.3](#).

11.4 Log Operations on Server

Appliance Statistics cluster functions are provided in the HA API to allow the application on the cluster server (appliance) to perform the following local log operations:

- Add a log to the log queue
- Remove a log from the log queue
- Obtain a list of the logs in the log queue
- Obtain an individual log from the log queue

These operations are described in the sub-sections below.

11.4.1 Adding and Removing Logs

A data log can be added to the local log queue (on the cluster server) using the function **`eCLD_ASCAddLog()`**. The log must be given an identifier and the UTC time at which the log was added must be specified. The length of the log, in bytes, must be less than the value of `CLD_APPLIANCE_STATISTICS_ATTR_LOG_MAX_SIZE`, which is defined in the `zcl_options.h` files (and must be less than or equal to 70).

The above function also sends a 'Log Notification' message to all bound Appliance Statistics cluster clients.

An existing log can be removed from the local log queue using the function **`eCLD_ASCRemoveLog()`**. The log is specified using its identifier.

11.4.2 Obtaining Logs

A list of the logs that are currently in the local log queue (on the cluster server) can be obtained by calling the function **`eCLD_ASCGetLogsAvailable()`**. This function provides the number of logs in the queue and a list of the log identifiers.

An individual log from the local log queue can be obtained using the function **`eCLD_ASCGetLogEntry()`**. The required log is specified by means of its identifier.

Normally, **`eCLD_ASCGetLogsAvailable()`** is called first to obtain a list of the available logs and then **`eCLD_ASCGetLogEntry()`** is called for each log.

11.5 Appliance Statistics Events

The Appliance Statistics cluster has its own events that are handled through the callback mechanism outlined in [Section 4.7](#) (and fully detailed in the *ZCL User Guide (JN-UG-3103)*). The cluster contains its own event handler. If a device uses this cluster then application-specific Appliance Statistics event handling must be included in the user-defined callback function for the associated endpoint, where this callback function is registered through the relevant endpoint registration function. This callback function will then be invoked when an Appliance Statistics event occurs and needs the attention of the application.

For an Appliance Statistics event, the `eEventType` field of the `tsZCL_CallBackEvent` structure is set to `E_ZCL_CBET_CLUSTER_CUSTOM`. This event structure also contains an element `sClusterCustomMessage`, which is itself a structure containing a field `pvCustomData`. This field is a pointer to the following `tsCLD_ApplianceStatisticsCallBackMessage` structure:

```
typedef struct
{
    uint8      u8CommandId;
    union
    {
        tsCLD_ASC_LogNotificationORLogResponsePayload
                                *psLogNotificationORLogResponsePayload;
        tsCLD_ASC_LogQueueResponseORStatisticsAvailablePayload
                                *psLogQueueResponseORStatisticsAvailablePayload;
        tsCLD_ASC_LogRequestPayload    *psLogRequestPayload;
    } uMessage;
} tsCLD_ApplianceStatisticsCallBackMessage;
```

When an Appliance Statistics event occurs, one of four command types could have been received. The relevant command type is specified through the `u8CommandId` field of the `tsSM_CallBackMessage` structure. The possible command types are detailed the tables below for events generated on a server and a client.

u8CommandId Enumeration	Description
E_CLD_APPLIANCE_STATISTICS_CMD_LOG_REQUEST	A 'Log Request' message has been received by the server (appliance)
E_CLD_APPLIANCE_STATISTICS_CMD_LOG_QUEUE_REQUEST	A 'Log Queue Request' message has been received by the server (appliance)

Table 63: Appliance Statistics Command Types (Events on Server)

u8CommandId Enumeration	Description
E_CLD_APPLIANCE_STATISTICS_CMD_LOG_NOTIFICATION	A 'Log Notification' message has been received by the client
E_CLD_APPLIANCE_STATISTICS_CMD_LOG_RESPONSE	A 'Log Response' message has been received by the client

Table 64: Appliance Statistics Command Types (Events on Client)

u8CommandId Enumeration	Description
E_CLD_APPLIANCE_STATISTICS_CMD_LOG_QUEUE_RESPONSE	A 'Log Queue Response' message has been received by the client
E_CLD_APPLIANCE_STATISTICS_CMD_STATISTICS_AVAILABLE	A 'Statistics Available' message has been received by the client

Table 64: Appliance Statistics Command Types (Events on Client)

11.6 Functions

The following Appliance Statistics cluster functions are provided in the HA API:

Function	Page
eCLD_ApplianceStatisticsCreateApplianceStatistics	222
eCLD_ASCAddLog	224
eCLD_ASCRemoveLog	225
eCLD_ASCGetLogsAvailable	226
eCLD_ASCGetLogEntry	227
eCLD_ASCLogQueueRequestSend	228
eCLD_ASCLogRequestSend	229
eCLD_ASCLogQueueResponseORStatisticsAvailableSend	230
eCLD_ASCStatisticsAvailableSend	232
eCLD_ASCLogNotificationORLogResponseSend	233
eCLD_ASCLogNotificationSend	235

eCLD_ApplianceStatisticsCreateApplianceStatistics

```
teZCL_Status  
eCLD_ApplianceStatisticsCreateApplianceStatistics(  
    tsZCL_ClusterInstance *psClusterInstance,  
    bool_t blsServer,  
    tsZCL_ClusterDefinition *psClusterDefinition,  
    void *pvEndPointSharedStructPtr,  
    uint8 *pu8AttributeControlBits,  
    tsCLD_ApplianceStatisticsCustomDataStructure  
        *psCustomDataStructure);
```

Description

This function creates an instance of the Appliance Statistics cluster on an endpoint. The cluster instance is created on the endpoint which is associated with the supplied `tsZCL_ClusterInstance` structure and can act as a server or a client, as specified.

The function should only be called when setting up a custom endpoint containing one or more selected clusters (rather than the whole set of clusters supported by a standard ZigBee device). This function will create an Appliance Statistics cluster instance on the endpoint, but instances of other clusters may also be created on the same endpoint by calling their corresponding creation functions. For more details of creating cluster instances on custom endpoints, refer to [Appendix A](#).

Note: This function must not be called for an endpoint on which a standard ZigBee device will be used. In this case, the device and its supported clusters must be registered on the endpoint using the relevant device registration function from those described in [Chapter 13](#).

When used, this function must be the first Appliance Statistics cluster function called in the application, and must be called after the stack has been started and after the application profile has been initialised.

The function requires an array to be declared for internal use, which contains one element (of type `uint8`) for each attribute of the cluster. Since the Appliance Statistics cluster client has no attributes, this array is only required for the server. The array length is automatically adjusted by the compiler using the following declaration (for the cluster server):

```
uint8 au8ApplianceStatisticsServerAttributeControlBits  
[(sizeof(asCLD_ApplianceStatisticsClusterAttributeDefinitions) /  
sizeof(tsZCL_AttributeDefinition))];
```

Parameters

<i>psClusterInstance</i>	Pointer to structure containing information about the cluster instance to be created (see the <i>ZCL User Guide (JN-UG-3103)</i>). This structure will be updated by the function by initialising individual structure fields.
<i>bIsServer</i>	Type of cluster instance (server or client) to be created: TRUE - server FALSE - client
<i>psClusterDefinition</i>	Pointer to structure indicating the type of cluster to be created (see the <i>ZCL User Guide (JN-UG-3103)</i>). In this case, this structure must contain the details of the Appliance Statistics cluster. This parameter can refer to a pre-filled structure called <code>sCLD_ApplianceStatistics</code> which is provided in the ApplianceStatistics.h file.
<i>pvEndPointSharedStructPtr</i>	Pointer to the shared structure used for attribute storage. This parameter should be the address of the structure of type <code>tsCLD_ApplianceStatistics</code> which defines the attributes of Appliance Statistics cluster. The function will initialise the attributes with default values.
<i>pu8AttributeControlBits</i>	Pointer to an array of uint8 values, with one element for each attribute in the cluster (see above). For a cluster client, set this pointer to NULL.
<i>psCustomDataStructure</i>	Pointer to a structure containing the storage for internal functions of the cluster (see Section 11.9.6).

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_INVALID_VALUE

eCLD_ASCAddLog

```
teZCL_CommandStatus eCLD_ASCAddLog(  
    uint8 u8SourceEndPointId,  
    uint32 u32LogId,  
    uint8 u8LogLength,  
    uint32 u32Time,  
    uint8 *pu8LogData);
```

Description

This function can be used on an Appliance Statistics cluster server to add a data log to the log queue. The function also sends out a 'Log Notification' message to all bound Appliance Statistics cluster clients.

The length of the data log, in bytes, must be less than the defined value of CLD_APPLIANCE_STATISTICS_ATTR_LOG_MAX_SIZE (which must be less than or equal to 70).

Parameter

<i>u8SourceEndPointId</i>	Number of the local endpoint on which the Appliance Statistics cluster server resides
<i>u32LogId</i>	Identifier of log
<i>u8LogLength</i>	Length of log, in bytes
<i>u32Time</i>	UTC time at which log was produced
<i>pu8LogData</i>	Pointer to log data

Returns

E_ZCL_CMDS_SUCCESS
E_ZCL_CMDS_FAIL
E_ZCL_CMDS_INVALID_VALUE (log too long)
E_ZCL_CMDS_INVALID_FIELD (NULL pointer to log data)
E_ZCL_CMDS_INSUFFICIENT_SPACE

eCLD_ASCRemoveLog

```
teZCL_CommandStatus eCLD_ASCRemoveLog(
    uint8 u8SourceEndPointId,
    uint32 u32LogId);
```

Description

This function can be used on an Appliance Statistics cluster server to remove the specified data log from the log queue.

Parameter

<i>u8SourceEndPointId</i>	Number of the local endpoint on which the Appliance Statistics cluster server resides
<i>u32LogId</i>	Identifier of log

Returns

E_ZCL_CMDS_SUCCESS
E_ZCL_CMDS_FAIL

eCLD_ASCGetLogsAvailable

```
teZCL_CommandStatus eCLD_ASCGetLogsAvailable(  
    uint8 u8SourceEndPointId,  
    uint32 *pu32LogId,  
    uint8 *pu8LogIdCount);
```

Description

This function can be used on an Appliance Statistics cluster server to obtain a list of the data logs in the log queue. The number of available logs and a list of their log IDs will be obtained.

Parameter

<i>u8SourceEndPointId</i>	Number of the local endpoint on which the Appliance Statistics cluster server resides
<i>pu32LogId</i>	Pointer to an area of memory to receive the list of 32-bit log IDs
<i>pu8LogIdCount</i>	Pointer to an area of memory to receive the number of logs in the queue

Returns

E_ZCL_CMDS_SUCCESS
E_ZCL_CMDS_FAIL

eCLD_ASCGetLogEntry

```
teZCL_CommandStatus eCLD_ASCGetLogEntry(
    uint8 u8SourceEndPointId,
    uint32 u32LogId,
    tsCLD_LogTable **ppsLogTable);
```

Description

This function can be used on an Appliance Statistics cluster server to obtain the data log with the specified log ID.

Parameter

<i>u8SourceEndPointId</i>	Number of the local endpoint on which the Appliance Statistics cluster server resides
<i>u32LogId</i>	Log ID of the required data log
<i>ppsLogTable</i>	Pointer to a memory location to receive a pointer to the required data log

Returns

E_ZCL_CMDS_SUCCESS
E_ZCL_CMDS_FAIL
E_ZCL_CMDS_NOT_FOUND (specified log not present)

eCLD_ASCLogQueueRequestSend

```
teZCL_Status eCLD_ASCLogQueueRequestSend(  
    uint8 u8SourceEndPointId,  
    uint8 u8DestinationEndPointId,  
    tsZCL_Address *psDestinationAddress,  
    uint8 *pu8TransactionSequenceNumber);
```

Description

This function can be used on an Appliance Statistics cluster client to send a 'Log Queue Request' message to a cluster server (appliance), in order enquire about the availability of logs on the server.

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of the local endpoint through which to send the message. This parameter is used both to send the message and to identify the instance of the shared structure holding the required attribute values
<i>u8DestinationEndPointId</i>	Number of the endpoint on the remote node to which the message will be sent. This parameter is ignored when sending to address types eZCL_AMBOUND and eZCL_AMGROUP
<i>psDestinationAddress</i>	Pointer to a structure holding the address of the node to which the message will be sent
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_INVALID_VALUE

eCLD_ASCLogRequestSend

```
teZCL_Status eCLD_ASCLogRequestSend(
    uint8 u8SourceEndPointId,
    uint8 u8DestinationEndPointId,
    tsZCL_Address *psDestinationAddress,
    uint8 *pu8TransactionSequenceNumber,
    tsCLD_ASC_LogRequestPayload *psPayload);
```

Description

This function can be used on an Appliance Statistics cluster client to send a 'Log Request' message to a cluster server (appliance), in order request the data log with a specified log ID.

The function should normally be called after enquiring about log availability using the function **eCLD_ASCLogQueueRequestSend()** or after receiving an unsolicited 'Statistics Available' notification from the server.

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of the local endpoint through which to send the message. This parameter is used both to send the message and to identify the instance of the shared structure holding the required attribute values
<i>u8DestinationEndPointId</i>	Number of the endpoint on the remote node to which the message will be sent. This parameter is ignored when sending to address types eZCL_AMBOUND and eZCL_AMGROUP
<i>psDestinationAddress</i>	Pointer to a structure holding the address of the node to which the message will be sent
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>psPayload</i>	Pointer to a structure containing the payload for the 'Log Request', including the relevant log ID (see Section 11.9.2)

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_INVALID_VALUE

eCLD_ASCLogQueueResponseORStatisticsAvailableSend

```
teZCL_Status  
eCLD_ASCLogQueueResponseORStatisticsAvailableSend(  
    uint8 u8SourceEndPointId,  
    uint8 u8DestinationEndPointId,  
    tsZCL_Address *psDestinationAddress,  
    uint8 *pu8TransactionSequenceNumber,  
    teCLD_ApplianceStatistics_ServerCommandId  
        eCommandId);
```

Description

This function can be used on an Appliance Statistics cluster server to send a 'Log Queue Response' message (in reply to a 'Log Queue Request' message) or an unsolicited 'Statistics Available' message to a cluster client.

The command to be sent must be specified as one of:

- E_CLD_APPLIANCE_STATISTICS_CMD_LOG_QUEUE_RESPONSE
- E_CLD_APPLIANCE_STATISTICS_CMD_STATISTICS_AVAILABLE

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of the local endpoint through which to send the message. This parameter is used both to send the message and to identify the instance of the shared structure holding the required attribute values
<i>u8DestinationEndPointId</i>	Number of the endpoint on the remote node to which the message will be sent. This parameter is ignored when sending to address types eZCL_AMBOUND and eZCL_AMGROUP
<i>psDestinationAddress</i>	Pointer to a structure holding the address of the node to which the message will be sent
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>eCommandId</i>	Enumeration indicating the command to be sent (see above and Section 11.8.3)

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_INVALID_VALUE

eCLD_ASCStatisticsAvailableSend

```
teZCL_Status eCLD_ASCStatisticsAvailableSend(  
    uint8 u8SourceEndPointId,  
    uint8 u8DestinationEndPointId,  
    tsZCL_Address *psDestinationAddress,  
    uint8 *pu8TransactionSequenceNumber);
```

Description

This function can be used on an Appliance Statistics cluster server to send an unsolicited 'Statistics Available' message to a cluster client. The function is an alternative to **eCLD_ASCLogQueueResponseORStatisticsAvailableSend()**.

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of the local endpoint through which to send the message. This parameter is used both to send the message and to identify the instance of the shared structure holding the required attribute values
<i>u8DestinationEndPointId</i>	Number of the endpoint on the remote node to which the message will be sent. This parameter is ignored when sending to address types eZCL_AMBOUND and eZCL_AMGROUP
<i>psDestinationAddress</i>	Pointer to a structure holding the address of the node to which the message will be sent
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_INVALID_VALUE

eCLD_ASCLogNotificationORLogResponseSend

```

teZCL_Status
eCLD_ASCLogNotificationORLogResponseSend(
    uint8 u8SourceEndPointId,
    uint8 u8DestinationEndPointId,
    tsZCL_Address *psDestinationAddress,
    uint8 *pu8TransactionSequenceNumber,
    teCLD_ApplianceStatistics_ServerCommandId
                                eCommandId,
    tsCLD_ASC_LogNotificationORLogResponsePayload
                                *psPayload);

```

Description

This function can be used on an Appliance Statistics cluster server to send a 'Log Response' message (in reply to a 'Log Request' message) or an unsolicited 'Log Notification' message to a cluster client.

The command to be sent must be specified as one of:

- E_CLD_APPLIANCE_STATISTICS_CMD_LOG_NOTIFICATION
- E_CLD_APPLIANCE_STATISTICS_CMD_LOG_RESPONSE

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of the local endpoint through which to send the message. This parameter is used both to send the message and to identify the instance of the shared structure holding the required attribute values
<i>u8DestinationEndPointId</i>	Number of the endpoint on the remote node to which the message will be sent. This parameter is ignored when sending to address types eZCL_AMBOUND and eZCL_AMGROUP
<i>psDestinationAddress</i>	Pointer to a structure holding the address of the node to which the message will be sent
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>eCommandId</i>	Enumeration indicating the command to be sent (see above and Section 11.8.3)
<i>psPayload</i>	Pointer to structure containing payload for message (see Section 11.9.3)

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_INVALID_VALUE

eCLD_ASCLogNotificationSend

```
teZCL_Status eCLD_ASCLogNotificationSend(
    uint8 u8SourceEndPointId,
    uint8 u8DestinationEndPointId,
    tsZCL_Address *psDestinationAddress,
    uint8 *pu8TransactionSequenceNumber,
    tsCLD_ASC_LogNotificationORLogResponsePayload
    *psPayload);
```

Description

This function can be used on an Appliance Statistics cluster server to send an unsolicited 'Log Notification' message to a cluster client. The function is an alternative to **eCLD_ASCLogNotificationORLogResponseSend()**.

You are required to provide a pointer to a location to receive a Transaction Sequence Number (TSN) for the message. The TSN in the response will be set to match the TSN in the request, allowing an incoming response to be paired with a request. This is useful when sending more than one request to the same destination endpoint.

Parameters

<i>u8SourceEndPointId</i>	Number of the local endpoint through which to send the message. This parameter is used both to send the message and to identify the instance of the shared structure holding the required attribute values
<i>u8DestinationEndPointId</i>	Number of the endpoint on the remote node to which the message will be sent. This parameter is ignored when sending to address types eZCL_AMBOUND and eZCL_AMGROUP
<i>psDestinationAddress</i>	Pointer to a structure holding the address of the node to which the message will be sent
<i>pu8TransactionSequenceNumber</i>	Pointer to a location to receive the Transaction Sequence Number (TSN) of the message
<i>psPayload</i>	Pointer to structure containing payload for message (see Section 11.9.3)

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_INVALID_VALUE

11.7 Return Codes

The Appliance Statistics cluster functions use the ZCL return codes defined in the *ZCL User Guide (JN-UG-3103)*.

11.8 Enumerations

11.8.1 'Attribute ID' Enumerations

The following structure contains the enumerations used to identify the attributes of the Appliance Statistics cluster.

```
typedef enum PACK
{
    E_CLD_APPLIANCE_STATISTICS_ATTR_ID_LOG_MAX_SIZE = 0x0000,
    E_CLD_APPLIANCE_STATISTICS_ATTR_ID_LOG_QUEUE_MAX_SIZE
} teCLD_ApplianceStatistics_Cluster_AttrID;
```

11.8.2 'Client Command ID' Enumerations

The following enumerations are used in commands issued on a cluster client.

```
typedef enum PACK
{
    E_CLD_APPLIANCE_STATISTICS_CMD_LOG_REQUEST = 0x00,
    E_CLD_APPLIANCE_STATISTICS_CMD_LOG_QUEUE_REQUEST
} teCLD_ApplianceStatistics_ClientCommandId;
```

The above enumerations are described in the table below.

Enumeration	Description
E_CLD_APPLIANCE_STATISTICS_CMD_LOG_REQUEST	'Log Request' message
E_CLD_APPLIANCE_STATISTICS_CMD_LOG_QUEUE_REQUEST	'Log Queue Request' message

Table 65: 'Client Command ID' Enumerations

11.8.3 'Server Command ID' Enumerations

The following enumerations are used in commands issued on a cluster server.

```
typedef enum PACK
{
    E_CLD_APPLIANCE_STATISTICS_CMD_LOG_NOTIFICATION = 0x00,
    E_CLD_APPLIANCE_STATISTICS_CMD_LOG_RESPONSE,
    E_CLD_APPLIANCE_STATISTICS_CMD_LOG_QUEUE_RESPONSE,
    E_CLD_APPLIANCE_STATISTICS_CMD_STATISTICS_AVAILABLE
} teCLD_ApplianceStatistics_ServerCommandId;
```

The above enumerations are described in the table below.

Enumeration	Description
E_CLD_APPLIANCE_STATISTICS_CMD_LOG_NOTIFICATION	A 'Log Notification' message
E_CLD_APPLIANCE_STATISTICS_CMD_LOG_RESPONSE	A 'Log Response' message
E_CLD_APPLIANCE_STATISTICS_CMD_LOG_QUEUE_RESPONSE	A 'Log Queue Response' message
E_CLD_APPLIANCE_STATISTICS_CMD_STATISTICS_AVAILABLE	A 'Statistics Available' message

Table 66: 'Server Command ID' Enumerations

11.9 Structures

11.9.1 tsCLD_ApplianceStatisticsCallbackMessage

For an Appliance Statistics event, the `eEventType` field of the `tsZCL_CallBackEvent` structure is set to `E_ZCL_CBET_CLUSTER_CUSTOM`. This event structure also contains an element `sClusterCustomMessage`, which is itself a structure containing a field `pvCustomData`. This field is a pointer to the following `tsCLD_ApplianceStatisticsCallbackMessage` structure:

```
typedef struct
{
    uint8    u8CommandId;
    union
    {
        tsCLD_ASC_LogNotificationORLogResponsePayload
            *psLogNotificationORLogResponsePayload;
        tsCLD_ASC_LogQueueResponseORStatisticsAvailablePayload
            *psLogQueueResponseORStatisticsAvailabePayload;
        tsCLD_ASC_LogRequestPayload *psLogRequestPayload;
    } uMessage;
} tsCLD_ApplianceStatisticsCallbackMessage;
```

where:

- `u8CommandId` indicates the type of Appliance Statistics command that has been received, one of:
 - `E_CLD_APPLIANCE_STATISTICS_CMD_LOG_REQUEST`
 - `E_CLD_APPLIANCE_STATISTICS_CMD_LOG_QUEUE_REQUEST`
 - `E_CLD_APPLIANCE_STATISTICS_CMD_LOG_NOTIFICATION`
 - `E_CLD_APPLIANCE_STATISTICS_CMD_LOG_RESPONSE`
 - `E_CLD_APPLIANCE_STATISTICS_CMD_LOG_QUEUE_RESPONSE`
 - `E_CLD_APPLIANCE_STATISTICS_CMD_STATISTICS_AVAILABLE`
- `uMessage` is a union containing the command payload as one of (depending on the value of `u8CommandId`):
 - `psLogNotificationORLogResponsePayload` is a pointer to the payload of a 'Log Notification' or 'Log Response' message (see [Section 11.9.3](#))
 - `psLogQueueResponseORStatisticsAvailabePayload` is a pointer to the payload of a 'Log Queue Response' or 'Statistics Available' message (see [Section 11.9.4](#))
 - `psLogRequestPayload` is a pointer to the payload of a 'Log Request' message (see [Section 11.9.2](#))

11.9.2 tsCLD_ASC_LogRequestPayload

This structure contains the payload for the 'Log Request' message.

```
typedef struct
{
    uint32_t    u32LogId;
} tsCLD_ASC_LogRequestPayload;
```

where `u32LogId` is the identifier of the data log being requested.

11.9.3 tsCLD_ASC_LogNotificationORLogResponsePayload

This structure contains the payload for the 'Log Notification' and 'Log Response' messages.

```
typedef struct
{
    time_t      utctTime;
    uint32_t    u32LogId;
    uint32_t    u32LogLength;
    uint8_t     *pu8LogData;
} tsCLD_ASC_LogNotificationORLogResponsePayload;
```

where:

- `utctTime` is the UTC time at which the reported log was produced
- `u32LogId` is the identifier of the reported log
- `u32LogLength` is the length, in bytes, of the reported log
- `pu8LogData` is a pointer to an area of memory to receive the data of the reported log

11.9.4 `tsCLD_ASC_LogQueueResponseORStatisticsAvailablePayload`

This structure contains the payload for the 'Log Queue Response' and 'Statistics Available' messages.

```
typedef struct
{
    uint8_t      u8LogQueueSize;
    uint32_t     *pu32LogId;
} tsCLD_ASC_LogQueueResponseORStatisticsAvailablePayload;
```

where:

- `u8LogQueueSize` indicates the number of logs currently in the log queue
- `pu32LogId` is a pointer to an area of memory to receive the sequence of 32-bit log IDs of the logs in the queue

11.9.5 `tsCLD_LogTable`

This structure is used to store the details of a data log.

```
typedef struct
{
    zutctime      utctTime;
    uint32_t      u32LogID;
    uint8_t       u8LogLength;
    uint8_t       *pu8LogData;
} tsCLD_LogTable;
```

where:

- `utctTime` is the UTC time at which the log was produced
- `u32LogId` is the identifier of the log
- `u32LogLength` is the length, in bytes, of the log
- `pu8LogData` is a pointer to an area of memory to receive the data of the log

11.9.6 tsCLD_ApplianceStatisticsCustomDataStructure

The Appliance Statistics cluster requires extra storage space to be allocated to be used by internal functions. The structure definition for this storage is shown below:

```
typedef struct
{
    tsZCL_ReceiveEventAddress sReceiveEventAddress;
    tsZCL_CallBackEvent sCustomCallBackEvent;
    tsCLD_ApplianceStatisticsCallBackMessage sCallBackMessage;
#if (defined CLD_APPLIANCE_STATISTICS) && (defined APPLIANCE_STATISTICS_SERVER)
    tsCLD_LogTable asLogTable[CLD_APPLIANCE_STATISTICS_ATTR_LOG_QUEUE_MAX_SIZE];
#endif
} tsCLD_ApplianceStatisticsCustomDataStructure;
```

The fields are for internal use and no knowledge of them is required.

11.10 Compile-Time Options

This section describes the compile-time options that may be enabled in the **zcl_options.h** file of an application that uses the Appliance Statistics cluster.

To enable the Appliance Statistics cluster in the code to be built, it is necessary to add the following line to the file:

```
#define CLD_APPLIANCE_STATISTICS
```

In addition, to enable the cluster as a client or server, it is also necessary to add one of the following lines to the same file:

```
#define APPLIANCE_STATISTICS_SERVER
#define APPLIANCE_STATISTICS_CLIENT
```

The Appliance Statistics cluster contains macros that may be optionally specified at compile-time by adding some or all the following lines to the **zcl_options.h** file.

Maximum Log Size

Add this line to configure the maximum size *n*, in bytes, of a data log:

```
#define CLD_APPLIANCE_STATISTICS_ATTR_LOG_MAX_SIZE n
```

The default value is 70 bytes, which is the upper limit on this value, and *n* must therefore not be greater than 70.

The same value must be defined on the cluster server and client.

Maximum Log Queue Length

Add this line to configure the maximum number of logs *n* in a log queue:

```
#define CLD_APPLIANCE_STATISTICS_ATTR_LOG_QUEUE_MAX_SIZE n
```

The default value is 15, which is the upper limit on this value, and *n* must therefore not be greater than 15.

The same value must be defined on the cluster server and client.

Enable Insertion of UTC Time

Add this line to enable the application to insert UTC time data into logs:

```
#define CLD_APPLIANCE_STATISTICS_ATTR_LOG_QUEUE_MAX_SIZE n
```

Disable APS Acknowledgements for Bound Transmissions

Add this line to disable APS acknowledgements for bound transmissions from this cluster:

```
#define CLD_ASC_BOUND_TX_WITH_APS_ACK_DISABLED
```

12. Electrical Measurement Cluster

This chapter outlines the Electrical Measurement cluster which is defined in the ZigBee Home Automation profile, and provides an interface for obtaining electrical measurements from a device.

The Electrical Measurement cluster has a Cluster ID of 0x0B04.

12.1 Overview

The Electrical Measurement cluster provides an interface for querying devices for electrical measurements.

- The server is located on the device which makes the electrical measurements
- The client is located on another device and queries the server for measurements

The Electrical Measurement cluster can be implemented on any HA device type. Separate instances of the cluster server can be implemented across multiple endpoints within the same physical unit - that is, one server instance per endpoint. An example is a power extension unit containing multiple outlets, where each power outlet allows electrical measurements to be made on the supplied power (e.g. AC RMS voltage and current).

The cluster is enabled by defining `CLD_ELECTRICAL_MEASUREMENT` in the **zcl_options.h** file - see [Section 3.5.1](#). Further compile-time options for the Electrical Measurement cluster are detailed in [Section 12.9](#).

The information that can potentially be stored in this cluster is organised into the following attribute sets:

- Basic Information
- DC Measurement
- DC Formatting
- AC (Non-phase Specific) Measurements
- AC (Non-phase Specific) Formatting
- AC (Single Phase or Phase A) Measurements
- AC Formatting
- DC Manufacturer Threshold Alarms
- AC Manufacturer Threshold Alarms
- AC Phase B Measurements
- AC Phase C Measurements

Note that not all of the above attribute sets are currently implemented in the NXP HA software and not all attributes within a supported attribute set are implemented (see [Section 12.2](#) for the supported attribute sets and attributes).

12.2 Cluster Structure and Attributes

The structure definition for the Electrical Measurement cluster (server) is:

```
typedef struct
{
    zbmap32                u32MeasurementType;    /* Mandatory */

#ifdef CLD_ELECTMEAS_ATTR_AC_FREQUENCY
    zuint16                ul6ACFrequency;
#endif

#ifdef CLD_ELECTMEAS_ATTR_RMS_VOLTAGE
    zuint16                ul6RMSVoltage;
#endif

#ifdef CLD_ELECTMEAS_ATTR_RMS_CURRENT
    zuint16                ul6RMSCurrent;
#endif

#ifdef CLD_ELECTMEAS_ATTR_ACTIVE_POWER
    zint16                 il6ActivePower;
#endif

#ifdef CLD_ELECTMEAS_ATTR_REACTIVE_POWER
    zint16                 il6ReactivePower;
#endif

#ifdef CLD_ELECTMEAS_ATTR_APPARENT_POWER
    zuint16                ul6ApparentPower;
#endif

#ifdef CLD_ELECTMEAS_ATTR_POWER_FACTOR
    zint8                  i8PowerFactor;
#endif

#ifdef CLD_ELECTMEAS_ATTR_AC_VOLTAGE_MULTIPLIER
    zuint16                ul6ACVoltageMultiplier;
#endif

#ifdef CLD_ELECTMEAS_ATTR_AC_VOLTAGE_DIVISOR
    zuint16                ul6ACVoltageDivisor;
#endif
}
```

```

#ifdef CLD_ELECTMEAS_ATTR_AC_CURRENT_MULTIPLIER
    uint16_t          ul6ACCurrentMultiplier;
#endif

#ifdef CLD_ELECTMEAS_ATTR_AC_CURRENT_DIVISOR
    uint16_t          ul6ACCurentDivisor;
#endif

#ifdef CLD_ELECTMEAS_ATTR_AC_POWER_MULTIPLIER
    uint16_t          ul6ACPowerMultiplier;
#endif

#ifdef CLD_ELECTMEAS_ATTR_AC_POWER_DIVISOR
    uint16_t          ul6ACPowerDivisor;
#endif

} tsCLD_ElectricalMeasurement;

```

where:

‘Basic Information’ Attribute Set

- `u32MeasurementType` is a mandatory attribute which is a bitmap indicating the types of electrical measurement that can be performed by the device on which the cluster server resides. The bitmap is detailed below (a bit is set to ‘1’ if the corresponding measurement type is supported, or to ‘0’ otherwise):

Bits	Measurement Type
0	Active measurement (AC)
1	Reactive measurement (AC)
2	Apparent measurement (AC)
3	Phase A measurement
4	Phase B measurement
5	Phase C measurement
6	DC measurement
7	Harmonics measurement
8	Power quality measurement
9-31	Reserved

'AC (Non-phase Specific) Measurements' Attribute Set

- `u16ACFrequency` is an optional attribute containing the most recent measurement of the AC frequency, in Hertz (Hz). The special value `0xFFFF` is used to indicate that the frequency cannot be measured.

'AC (Single Phase or Phase A) Measurements' Attribute Set

Note that the attributes `u16RMSVoltage`, `u16RMSCurrent` and `i16ActivePower` must be enabled in conjunction with the corresponding multiplier/divisor pair in the 'AC Formatting' attribute set.

- `u16RMSVoltage` is an optional attribute containing the most recent measurement of the Root Mean Square (RMS) voltage, in Volts. The special value `0xFFFF` is used to indicate that the RMS voltage cannot be measured. Note that the 'AC Formatting' attributes `u16ACVoltageMultiplier` and `u16ACVoltageDivisor` must be implemented with this attribute.
- `u16RMSCurrent` is an optional attribute containing the most recent measurement of the Root Mean Square (RMS) current, in Amps. The special value `0xFFFF` is used to indicate that the RMS current cannot be measured. Note that the 'AC Formatting' attributes `u16ACCurrentMultiplier` and `u16ACCurrentDivisor` must be implemented with this attribute.
- `i16ActivePower` is an optional attribute containing the present single-phase or Phase-A demand for active power, in Watts (W). A positive value represents active power delivered to the premises and a negative value represents active power received from the premises. Note that the 'AC Formatting' attributes `u16ACPowerMultiplier` and `u16ACPowerDivisor` must be implemented with this attribute.
- `i16ReactivePower` is an optional attribute containing the present single-phase or Phase-A demand for reactive power, in Volts-Amps-reactive (VAr). A positive value represents reactive power delivered to the premises and a negative value represents reactive power received from the premises.
- `u16ApparentPower` is an optional attribute containing the present single-phase or Phase-A demand for apparent power, in Volts-Amps (VA). This value is the positive square-root of `i16ActivePower` squared plus `i16ReactivePower` squared.
- `i8PowerFactor` is an optional attribute containing the single-phase or Phase-A power factor ratio represented as a multiple of 0.01 (e.g. the attribute value `0x0C` represents a ratio of 0.12).

'AC Formatting' Attribute Set

The following attributes come in multiplier/divisor pairs, where each pair corresponds to an attribute of the 'AC (Single Phase or Phase A) Measurements' attribute set and must only be enabled if the corresponding attribute is enabled.

- `u16ACVoltageMultiplier` is an optional attribute containing the multiplication factor to be applied to the value of the `u16RMSVoltage` attribute (above). This multiplication factor must be used in conjunction with the `u16ACVoltageDivisor` division factor. The value `0x0000` is not valid.

- `u16ACVoltageDivisor` is an optional attribute containing the division factor to be applied to the value of the `u16RMSVoltage` attribute (above). This division factor must be used in conjunction with the `u16ACVoltageMultiplier` multiplication factor. The value 0x0000 is not valid.
- `u16ACCurrentMultiplier` is an optional attribute containing the multiplication factor to be applied to the value of the `u16RMSCurrent` attribute (above). This multiplication factor must be used in conjunction with the `u16ACCurrentDivisor` division factor. The value 0x0000 is not valid.
- `u16ACCurrentDivisor` is an optional attribute containing the division factor to be applied to the value of the `u16RMSCurrent` attribute (above). This division factor must be used in conjunction with the `u16ACCurrentMultiplier` multiplication factor. The value 0x0000 is not valid.
- `u16ACPowerMultiplier` is an optional attribute containing the multiplication factor to be applied to the value of the `i16ActivePower` attribute (above). This multiplication factor must be used in conjunction with the `u16ACPowerDivisor` division factor. The value 0x0000 is not valid.
- `u16ACPowerDivisor` is an optional attribute containing the division factor to be applied to the value of the `i16ActivePower` attribute (above). This division factor must be used in conjunction with the `u16ACPowerMultiplier` multiplication factor. The value 0x0000 is not valid.

12.3 Initialisation and Operation

The Electrical Measurement cluster must be initialised on both the cluster server and client. This can be done using the function

eCLD_ElectricalMeasurementCreateElectricalMeasurement(), which creates an instance of the Electrical Measurement cluster on a local endpoint.

Once the cluster has been initialised, the application on the server should maintain the cluster attributes (see [Section 12.2](#)) with the electrical measurements made by the local device. The application on a client can remotely read these measured values using the ZCL 'Read Attribute' functions, as described in [Section 4.5](#).

12.4 Electrical Measurement Events

There are no events specific to the Electrical Measurement cluster.

12.5 Functions

The following Electrical Measurement cluster function is provided in the HA API:

Function	Page
eCLD_ElectricalMeasurementCreateElectricalMeasurement	248

eCLD_ElectricalMeasurementCreateElectricalMeasurement

```
teZCL_Status  
eCLD_ElectricalMeasurementCreateElectricalMeasurement(  
    tsZCL_ClusterInstance *psClusterInstance,  
    bool_t blsServer,  
    tsZCL_ClusterDefinition *psClusterDefinition,  
    void *pvEndPointSharedStructPtr,  
    uint8 *pu8AttributeControlBits);
```

Description

This function creates an instance of the Electrical Measurement cluster on an endpoint. The cluster instance is created on the endpoint which is associated with the supplied `tsZCL_ClusterInstance` structure and can act as a server or a client, as specified.

The function should only be called when setting up a custom endpoint containing one or more selected clusters (rather than the whole set of clusters supported by a standard ZigBee device). This function will create an Electrical Measurement cluster instance on the endpoint, but instances of other clusters may also be created on the same endpoint by calling their corresponding creation functions. For more details of creating cluster instances on custom endpoints, refer to [Appendix A](#).

Note: This function must not be called for an endpoint on which a standard ZigBee device will be used. In this case, the device and its supported clusters must be registered on the endpoint using the relevant device registration function from those described in [Chapter 13](#).

When used, this function must be called after the stack has been started and after the application profile has been initialised.

The function requires an array to be declared for internal use, which contains one element (of type `uint8`) for each attribute of the cluster. Since the Electrical Measurement cluster client has no attributes, this array is only required for the server. The array length is automatically adjusted by the compiler using the following declaration (for the cluster server):

```
uint8 au8ElectricalMeasurementServerAttributeControlBits  
[(sizeof(asCLD_ElectricalMeasurementClusterAttributeDefinitions) /  
sizeof(tsZCL_AttributeDefinition))];
```

Parameters

<i>psClusterInstance</i>	Pointer to structure containing information about the cluster instance to be created (see the <i>ZCL User Guide (JN-UG-3103)</i>). This structure will be updated by the function by initialising individual structure fields.
<i>blsServer</i>	Type of cluster instance (server or client) to be created: TRUE - server FALSE - client
<i>psClusterDefinition</i>	Pointer to structure indicating the type of cluster to be created (see the <i>ZCL User Guide (JN-UG-3103)</i>). In this case, this structure must contain the details of the Electrical Measurement cluster. This parameter can refer to a pre-filled structure called <code>sCLD_ElectricalMeasurement</code> which is provided in the ElectricalMeasurement.h file.
<i>pvEndPointSharedStructPtr</i>	Pointer to the shared structure used for attribute storage. This parameter should be the address of the structure of type <code>tsCLD_ElectricalMeasurement</code> which defines the attributes of Electrical Measurement cluster. The function will initialise the attributes with default values.
<i>pu8AttributeControlBits</i>	Pointer to an array of uint8 values, with one element for each attribute in the cluster (see above). For a cluster client, set this pointer to NULL.

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_INVALID_VALUE

12.6 Return Codes

The Electrical Measurement cluster function uses the ZCL return codes defined in the *ZCL User Guide (JN-UG-3103)*.

12.7 Enumerations

12.7.1 'Attribute ID' Enumerations

The following structure contains the enumerations used to identify the attributes of the Electrical Measurement cluster.

```
typedef enum
{
    E_CLD_ELECTMEAS_ATTR_ID_MEASUREMENT_TYPE           = 0x0000,
    E_CLD_ELECTMEAS_ATTR_ID_AC_FREQUENCY               = 0x0300,
    E_CLD_ELECTMEAS_ATTR_ID_RMS_VOLTAGE                = 0x0505,
    E_CLD_ELECTMEAS_ATTR_ID_RMS_CURRENT               = 0x0508,
    E_CLD_ELECTMEAS_ATTR_ID_ACTIVE_POWER              = 0x050B,
    E_CLD_ELECTMEAS_ATTR_ID_REACTIVE_POWER            = 0x050E,
    E_CLD_ELECTMEAS_ATTR_ID_APPARENT_POWER            = 0x050F,
    E_CLD_ELECTMEAS_ATTR_ID_POWER_FACTOR              = 0x0510,
    E_CLD_ELECTMEAS_ATTR_ID_AC_VOLTAGE_MULTIPLIER     = 0x0600,
    E_CLD_ELECTMEAS_ATTR_ID_AC_VOLTAGE_DIVISOR        = 0x0601,
    E_CLD_ELECTMEAS_ATTR_ID_AC_CURRENT_MULTIPLIER     = 0x0602,
    E_CLD_ELECTMEAS_ATTR_ID_AC_CURRENT_DIVISOR        = 0x0603,
    E_CLD_ELECTMEAS_ATTR_ID_AC_POWER_MULTIPLIER       = 0x0604,
    E_CLD_ELECTMEAS_ATTR_ID_AC_POWER_DIVISOR         = 0x0605,
} teCLD_ElectricalMeasurement_AttributeID;
```

12.8 Structures

There are no structures specific to the Electrical Measurement cluster.

12.9 Compile-Time Options

This section describes the compile-time options that may be enabled in the **zcl_options.h** file of an application that uses the Electrical Measurement cluster.

To enable the Electrical Measurement cluster in the code to be built, it is necessary to add the following line to the file:

```
#define CLD_ELECTRICAL_MEASUREMENT
```

In addition, to enable the cluster as a client or server, it is also necessary to add one of the following lines to the same file:

```
#define ELECTRICAL_MEASUREMENT_SERVER
```

```
#define ELECTRICAL_MEASUREMENT_CLIENT
```

Optional Attributes

The optional attributes for the Electrical Measurement cluster (see [Section 12.2](#)) are enabled by defining:

- CLD_ELECTMEAS_ATTR_AC_FREQUENCY
- CLD_ELECTMEAS_ATTR_RMS_VOLTAGE
- CLD_ELECTMEAS_ATTR_RMS_CURRENT
- CLD_ELECTMEAS_ATTR_ACTIVE_POWER
- CLD_ELECTMEAS_ATTR_REACTIVE_POWER
- CLD_ELECTMEAS_ATTR_APPARENT_POWER
- CLD_ELECTMEAS_ATTR_POWER_FACTOR
- CLD_ELECTMEAS_ATTR_AC_VOLTAGE_MULTIPLIER
- CLD_ELECTMEAS_ATTR_AC_VOLTAGE_DIVISOR
- CLD_ELECTMEAS_ATTR_AC_CURRENT_MULTIPLIER
- CLD_ELECTMEAS_ATTR_AC_CURRENT_DIVISOR
- CLD_ELECTMEAS_ATTR_AC_POWER_MULTIPLIER
- CLD_ELECTMEAS_ATTR_AC_POWER_DIVISOR

Part III:

General Reference Information

13. HA Core Functions

This chapter details the core functions of the ZigBee Home Automation API. These comprise the following initialisation function, timing update function and device-specific endpoint registration functions:

Function	Page
eHA_Initialise	256
eHA_Update100mS	257
eHA_RegisterOnOffSwitchEndPoint	258
eHA_RegisterOnOffOutputEndPoint	260
eHA_RegisterRemoteControlEndPoint	262
eHA_RegisterDoorLockEndPoint	264
eHA_RegisterDoorLockControllerEndPoint	266
eHA_RegisterSimpleSensorEndPoint	268
eHA_RegisterSmartPlugEndPoint	270
eHA_RegisterOnOffLightEndPoint	272
eHA_RegisterDimmableLightEndPoint	274
eHA_RegisterColourDimmableLightEndPoint	276
eHA_RegisterOnOffLightSwitchEndPoint	278
eHA_RegisterDimmerSwitchEndPoint	280
eHA_RegisterColourDimmerSwitchEndPoint	282
eHA_RegisterLightSensorEndPoint	284
eHA_RegisterOccupancySensorEndPoint	286
eHA_RegisterThermostatEndPoint	288
eHA_RegisterIASCIEEndPoint	290
eHA_RegisterIASACEEndPoint	292
eHA_RegisterIASZoneEndPoint	294
eHA_RegisterIASWarningDeviceEndPoint	296

Note 1: For guidance on using these functions in your application code, refer to [Chapter 4](#).

Note 2: The return codes for these functions are described in the *ZCL User Guide (JN-UG-3103)*.

Note 3: HA initialisation must also be performed through definitions in the header file **zcl_options.h** - see [Section 3.5.1](#). In addition, JenOS resources for HA must also be pre-configured using the JenOS Configuration Editor - refer to the *JenOS User Guide (JN-UG-3075)*.

eHA_Initialise

```
teZCL_Status eHA_Initialise(  
    tfpZCL_ZCLCallbackFunction cbCallback,  
    PDUM_thAPdu hAPdu);
```

Description

This function initialises the ZCL and HA libraries. It should be called before registering any endpoints (using one of the device-specific endpoint registration functions from this chapter) and before starting the ZigBee PRO stack.

As part of this function call, you must specify a user-defined callback function that will be invoked when a ZigBee PRO stack event occurs that is not associated with an endpoint (the callback function for events associated with an endpoint is specified when the endpoint is registered using one of the registration functions). This callback function is defined according to the typedef:

```
typedef void (* tfpZCL_ZCLCallbackFunction)  
    (tsZCL_CallbackEvent *pCallbackEvent);
```

You must also provide a pointer to a local pool of Application Protocol Data Units (APDUs) that will be used by the ZCL to hold messages to be sent and received.

Parameters

<i>cbCallback</i>	Pointer to a callback function to handle stack events that are not associated with a registered endpoint
<i>hAPdu</i>	Pointer to a pool of APDUs for holding messages to be sent and received

Returns

E_ZCL_SUCCESS
E_ZCL_ERR_HEAP_FAIL
E_ZCL_ERR_PARAMETER_NULL

eHA_Update100mS

```
teZCL_Status eHA_Update100mS(void);
```

Description

This function is used to service all the timing needs of the clusters used by the HA application and should be called every 100 ms - this can be achieved by using a 100-ms software timer to periodically prompt execution of this function.

The function calls the external user-defined function **vIdEffectTick()**, which can be used to implement an identify effect on the node. This function must be defined in the application, irrespective of whether identify effects are needed (and thus, may be empty). The function prototype is:

```
void vIdEffectTick(void)
```

Parameters

None

Returns

E_ZCL_SUCCESS

eHA_RegisterOnOffSwitchEndPoint

```
teZCL_Status eHA_RegisterOnOffSwitchEndPoint(  
    uint8 u8EndPointIdentifier,  
    tfpZCL_ZCLCallBackFunction cbCallBack,  
    tsHA_OnOffSwitchDevice *psDeviceInfo);
```

Description

This function is used to register an endpoint which will support an On/Off Switch device. The function must be called after the **eHA_Initialise()** function and before starting the ZigBee PRO stack.

The specified identifier for the endpoint is a number in the range 1 to 240 (endpoint 0 is reserved for ZigBee use). HA endpoints are normally numbered consecutively starting at 1. The specified number must be less than or equal to the value of **HA_NUMBER_OF_ENDPOINTS** defined in the **zcl_options.h** file, which represents the highest endpoint number used for HA.

As part of this function call, you must specify a user-defined callback function that will be invoked when an event occurs that is associated with the endpoint. This callback function is defined according to the typedef:

```
typedef void (* tfpZCL_ZCLCallBackFunction)  
    (tsZCL_CallBackEvent *pCallBackEvent);
```

You must also provide a pointer to a **tsHA_OnOffSwitchDevice** structure (see [Section 14.1.1](#)) which will be used to store all variables relating to the On/Off Switch device associated with the endpoint. The **sEndPoint** and **sClusterInstance** fields of this structure are set by this function and must not be directly written to by the application.

The function may be called multiple times if more than one endpoint is being used - for example, if more than one On/Off Switch device is housed in the same hardware, sharing the same JN516x module.

Parameters

<i>u8EndPointIdentifier</i>	Endpoint that is to be associated with the registered structure and callback function
<i>cbCallBack</i>	Pointer to the function that the HA library will use to indicate events to the application for this endpoint
<i>psDeviceInfo</i>	Pointer to the structure that will act as storage for all variables related to the device being registered on this endpoint (see Section 14.1.1). The sEndPoint and sClusterInstance fields are set by this register function for internal use and must not be written to by the application

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_PARAMETER_RANGE
E_ZCL_ERR_EP_RANGE
E_ZCL_ERR_CLUSTER_0
E_ZCL_ERR_CALLBACK_NULL

eHA_RegisterOnOffOutputEndPoint

```
teZCL_Status eHA_RegisterOnOffOutputEndPoint(  
    uint8 u8EndPointIdentifier,  
    tfpZCL_ZCLCallBackFunction cbCallBack,  
    tsHA_OnOffOutputDevice *psDeviceInfo);
```

Description

This function is used to register an endpoint which will support an On/Off Output device. The function must be called after the **eHA_Initialise()** function and before starting the ZigBee PRO stack.

The specified identifier for the endpoint is a number in the range 1 to 240 (endpoint 0 is reserved for ZigBee use). HA endpoints are normally numbered consecutively starting at 1. The specified number must be less than or equal to the value of **HA_NUMBER_OF_ENDPOINTS** defined in the **zcl_options.h** file, which represents the highest endpoint number used for HA.

As part of this function call, you must specify a user-defined callback function that will be invoked when an event occurs that is associated with the endpoint. This callback function is defined according to the typedef:

```
typedef void (* tfpZCL_ZCLCallBackFunction)  
    (tsZCL_CallBackEvent *pCallBackEvent);
```

You must also provide a pointer to a **tsHA_OnOffOutputDevice** structure (see [Section 14.1.2](#)) which will be used to store all variables relating to the On/Off Output device associated with the endpoint. The **sEndPoint** and **sClusterInstance** fields of this structure are set by this function and must not be directly written to by the application.

The function may be called multiple times if more than one endpoint is being used - for example, if more than one On/Off Output device is housed in the same hardware, sharing the same JN516x module.

Parameters

<i>u8EndPointIdentifier</i>	Endpoint that is to be associated with the registered structure and callback function
<i>cbCallBack</i>	Pointer to the function that the HA library will use to indicate events to the application for this endpoint
<i>psDeviceInfo</i>	Pointer to the structure that will act as storage for all variables related to the device being registered on this endpoint (see Section 14.1.2). The sEndPoint and sClusterInstance fields are set by this register function for internal use and must not be written to by the application

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_PARAMETER_RANGE
E_ZCL_ERR_EP_RANGE
E_ZCL_ERR_CLUSTER_0
E_ZCL_ERR_CALLBACK_NULL

eHA_RegisterRemoteControlEndPoint

```
teZCL_Status eHA_RegisterRemoteControlEndPoint(  
    uint8 u8EndPointIdentifier,  
    tfpZCL_ZCLCallbackFunction cbCallBack,  
    tsHA_RemoteControlDevice *psDeviceInfo);
```

Description

This function is used to register an endpoint which will support a Remote Control device. The function must be called after the **eHA_Initialise()** function and before starting the ZigBee PRO stack.

The specified identifier for the endpoint is a number in the range 1 to 240 (endpoint 0 is reserved for ZigBee use). HA endpoints are normally numbered consecutively starting at 1. The specified number must be less than or equal to the value of **HA_NUMBER_OF_ENDPOINTS** defined in the **zcl_options.h** file, which represents the highest endpoint number used for HA.

As part of this function call, you must specify a user-defined callback function that will be invoked when an event occurs that is associated with the endpoint. This callback function is defined according to the typedef:

```
typedef void (* tfpZCL_ZCLCallbackFunction)  
    (tsZCL_CallbackEvent *pCallBackEvent);
```

You must also provide a pointer to a **tsHA_RemoteControlDevice** structure (see [Section 14.1.3](#)) which will be used to store all variables relating to the Remote Control device associated with the endpoint. The **sEndPoint** and **sClusterInstance** fields of this structure are set by this function and must not be directly written to by the application.

The function may be called multiple times if more than one endpoint is being used - for example, if more than one Remote Control device is housed in the same hardware, sharing the same JN516x module.

Parameters

<i>u8EndPointIdentifier</i>	Endpoint that is to be associated with the registered structure and callback function
<i>cbCallBack</i>	Pointer to the function that the HA library will use to indicate events to the application for this endpoint
<i>psDeviceInfo</i>	Pointer to the structure that will act as storage for all variables related to the device being registered on this endpoint (see Section 14.1.3). The sEndPoint and sClusterInstance fields are set by this register function for internal use and must not be written to by the application

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_PARAMETER_RANGE
E_ZCL_ERR_EP_RANGE
E_ZCL_ERR_CLUSTER_0
E_ZCL_ERR_CALLBACK_NULL

eHA_RegisterDoorLockEndPoint

```
teZCL_Status eHA_RegisterDoorLockEndPoint(  
    uint8 u8EndPointIdentifier,  
    tfpZCL_ZCLCallbackFunction cbCallBack,  
    tsHA_DoorLockDevice *psDeviceInfo);
```

Description

This function is used to register an endpoint which will support a Door Lock device. The function must be called after the **eHA_Initialise()** function and before starting the ZigBee PRO stack.

The specified identifier for the endpoint is a number in the range 1 to 240 (endpoint 0 is reserved for ZigBee use). HA endpoints are normally numbered consecutively starting at 1. The specified number must be less than or equal to the value of **HA_NUMBER_OF_ENDPOINTS** defined in the **zcl_options.h** file, which represents the highest endpoint number used for HA.

As part of this function call, you must specify a user-defined callback function that will be invoked when an event occurs that is associated with the endpoint. This callback function is defined according to the typedef:

```
typedef void (* tfpZCL_ZCLCallbackFunction)  
    (tsZCL_CallbackEvent *pCallBackEvent);
```

You must also provide a pointer to a **tsHA_DoorLockDevice** structure (see [Section 14.1.4](#)) which will be used to store all variables relating to the Door Lock device associated with the endpoint. The **sEndPoint** and **sClusterInstance** fields of this structure are set by this function and must not be directly written to by the application.

The function may be called multiple times if more than one endpoint is being used - for example, if more than one Door Lock device is housed in the same hardware, sharing the same JN516x module.

Parameters

<i>u8EndPointIdentifier</i>	Endpoint that is to be associated with the registered structure and callback function
<i>cbCallBack</i>	Pointer to the function that the HA library will use to indicate events to the application for this endpoint
<i>psDeviceInfo</i>	Pointer to the structure that will act as storage for all variables related to the device being registered on this endpoint (see Section 14.1.4). The sEndPoint and sClusterInstance fields are set by this register function for internal use and must not be written to by the application

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_PARAMETER_RANGE
E_ZCL_ERR_EP_RANGE
E_ZCL_ERR_CLUSTER_0
E_ZCL_ERR_CALLBACK_NULL

eHA_RegisterDoorLockControllerEndPoint

```
teZCL_Status eHA_RegisterDoorLockControllerEndPoint(  
    uint8 u8EndPointIdentifier,  
    tfpZCL_ZCLCallBackFunction cbCallBack,  
    tsHA_DoorLockControllerDevice *psDeviceInfo);
```

Description

This function is used to register an endpoint which will support a Door Lock Controller device. The function must be called after the **eHA_Initialise()** function and before starting the ZigBee PRO stack.

The specified identifier for the endpoint is a number in the range 1 to 240 (endpoint 0 is reserved for ZigBee use). HA endpoints are normally numbered consecutively starting at 1. The specified number must be less than or equal to the value of **HA_NUMBER_OF_ENDPOINTS** defined in the **zcl_options.h** file, which represents the highest endpoint number used for HA.

As part of this function call, you must specify a user-defined callback function that will be invoked when an event occurs that is associated with the endpoint. This callback function is defined according to the typedef:

```
typedef void (* tfpZCL_ZCLCallBackFunction)  
    (tsZCL_CallBackEvent *pCallBackEvent);
```

You must also provide a pointer to a **tsHA_DoorLockControllerDevice** structure (see [Section 14.1.5](#)) which will be used to store all variables relating to the Door Lock Controller device associated with the endpoint. The **sEndPoint** and **sClusterInstance** fields of this structure are set by this function and must not be directly written to by the application.

The function may be called multiple times if more than one endpoint is being used - for example, if more than one Door Lock Controller device is housed in the same hardware, sharing the same JN516x module.

Parameters

<i>u8EndPointIdentifier</i>	Endpoint that is to be associated with the registered structure and callback function
<i>cbCallBack</i>	Pointer to the function that the HA library will use to indicate events to the application for this endpoint
<i>psDeviceInfo</i>	Pointer to the structure that will act as storage for all variables related to the device being registered on this endpoint (see Section 14.1.5). The sEndPoint and sClusterInstance fields are set by this register function for internal use and must not be written to by the application

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_PARAMETER_RANGE
E_ZCL_ERR_EP_RANGE
E_ZCL_ERR_CLUSTER_0
E_ZCL_ERR_CALLBACK_NULL

eHA_RegisterSimpleSensorEndPoint

```
teZCL_Status eHA_RegisterSimpleSensorEndPoint(  
    uint8 u8EndPointIdentifier,  
    tfpZCL_ZCLCallBackFunction cbCallBack,  
    tsHA_SimpleSensorDevice *psDeviceInfo);
```

Description

This function is used to register an endpoint which will support a Simple Sensor device. The function must be called after the **eHA_Initialise()** function and before starting the ZigBee PRO stack.

The specified identifier for the endpoint is a number in the range 1 to 240 (endpoint 0 is reserved for ZigBee use). HA endpoints are normally numbered consecutively starting at 1. The specified number must be less than or equal to the value of **HA_NUMBER_OF_ENDPOINTS** defined in the **zcl_options.h** file, which represents the highest endpoint number used for HA.

As part of this function call, you must specify a user-defined callback function that will be invoked when an event occurs that is associated with the endpoint. This callback function is defined according to the typedef:

```
typedef void (* tfpZCL_ZCLCallBackFunction)  
    (tsZCL_CallBackEvent *pCallBackEvent);
```

You must also provide a pointer to a **tsHA_SimpleSensorDevice** structure (see [Section 14.1.6](#)) which will be used to store all variables relating to the Simple Sensor device associated with the endpoint. The **sEndPoint** and **sClusterInstance** fields of this structure are set by this function and must not be directly written to by the application.

The function may be called multiple times if more than one endpoint is being used - for example, if more than one Simple Sensor device is housed in the same hardware, sharing the same JN516x module.

Parameters

<i>u8EndPointIdentifier</i>	Endpoint that is to be associated with the registered structure and callback function
<i>cbCallBack</i>	Pointer to the function that the HA library will use to indicate events to the application for this endpoint
<i>psDeviceInfo</i>	Pointer to the structure that will act as storage for all variables related to the device being registered on this endpoint (see Section 14.1.6). The sEndPoint and sClusterInstance fields are set by this register function for internal use and must not be written to by the application

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_PARAMETER_RANGE
E_ZCL_ERR_EP_RANGE
E_ZCL_ERR_CLUSTER_0
E_ZCL_ERR_CALLBACK_NULL

eHA_RegisterSmartPlugEndPoint

```
teZCL_Status eHA_RegisterSmartPlugEndPoint(  
    uint8 u8EndPointIdentifier,  
    tfpZCL_ZCLCallbackFunction cbCallBack,  
    tsHA_SmartPlugDevice *psDeviceInfo);
```

Description

This function is used to register an endpoint which will support a Smart Plug device. The function must be called after the **eHA_Initialise()** function and before starting the ZigBee PRO stack.

The specified identifier for the endpoint is a number in the range 1 to 240 (endpoint 0 is reserved for ZigBee use). HA endpoints are normally numbered consecutively starting at 1. The specified number must be less than or equal to the value of **HA_NUMBER_OF_ENDPOINTS** defined in the **zcl_options.h** file, which represents the highest endpoint number used for HA.

As part of this function call, you must specify a user-defined callback function that will be invoked when an event occurs that is associated with the endpoint. This callback function is defined according to the typedef:

```
typedef void (* tfpZCL_ZCLCallbackFunction)  
    (tsZCL_CallBackEvent *pCallBackEvent);
```

You must also provide a pointer to a **tsHA_SmartPlugDevice** structure (see [Section 14.1.7](#)) which will be used to store all variables relating to the Smart Plug device associated with the endpoint. The **sEndPoint** and **sClusterInstance** fields of this structure are set by this function and must not be directly written to by the application.

The function may be called multiple times if more than one endpoint is being used - for example, if more than one Smart Plug device is housed in the same hardware, sharing the same JN516x module.

Parameters

<i>u8EndPointIdentifier</i>	Endpoint that is to be associated with the registered structure and callback function
<i>cbCallBack</i>	Pointer to the function that the HA library will use to indicate events to the application for this endpoint
<i>psDeviceInfo</i>	Pointer to the structure that will act as storage for all variables related to the device being registered on this endpoint (see Section 14.1.7). The sEndPoint and sClusterInstance fields are set by this register function for internal use and must not be written to by the application

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_PARAMETER_RANGE
E_ZCL_ERR_EP_RANGE
E_ZCL_ERR_CLUSTER_0
E_ZCL_ERR_CALLBACK_NULL

eHA_RegisterOnOffLightEndPoint

```
teZCL_Status eHA_RegisterOnOffLightEndPoint(  
    uint8 u8EndPointIdentifier,  
    tfpZCL_ZCLCallbackFunction cbCallback,  
    tsHA_OnOffLightDevice *psDeviceInfo);
```

Description

This function is used to register an endpoint which will support an On/Off Light device. The function must be called after the **eHA_Initialise()** function and before starting the ZigBee PRO stack.

The specified identifier for the endpoint is a number in the range 1 to 240 (endpoint 0 is reserved for ZigBee use). HA endpoints are normally numbered consecutively starting at 1. The specified number must be less than or equal to the value of **HA_NUMBER_OF_ENDPOINTS** defined in the **zcl_options.h** file, which represents the highest endpoint number used for HA.

As part of this function call, you must specify a user-defined callback function that will be invoked when an event occurs that is associated with the endpoint. This callback function is defined according to the typedef:

```
typedef void (* tfpZCL_ZCLCallbackFunction)  
    (tsZCL_CallbackEvent *pCallbackEvent);
```

You must also provide a pointer to a **tsHA_OnOffLightDevice** structure (see [Section 14.2.1](#)) which will be used to store all variables relating to the On/Off Light device associated with the endpoint. The **sEndPoint** and **sClusterInstance** fields of this structure are set by this function and must not be directly written to by the application.

The function may be called multiple times if more than one endpoint is being used - for example, if more than one On/Off Light device is housed in the same hardware, sharing the same JN516x module.

Parameters

<i>u8EndPointIdentifier</i>	Endpoint that is to be associated with the registered structure and callback function
<i>cbCallback</i>	Pointer to the function that the HA library will use to indicate events to the application for this endpoint
<i>psDeviceInfo</i>	Pointer to the structure that will act as storage for all variables related to the device being registered on this endpoint (see Section 14.2.1). The sEndPoint and sClusterInstance fields are set by this register function for internal use and must not be written to by the application

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_PARAMETER_RANGE
E_ZCL_ERR_EP_RANGE
E_ZCL_ERR_CLUSTER_0
E_ZCL_ERR_CALLBACK_NULL

eHA_RegisterDimmableLightEndPoint

```
teZCL_Status eHA_RegisterDimmableLightEndPoint(  
    uint8 u8EndPointIdentifier,  
    tfpZCL_ZCLCallbackFunction cbCallBack,  
    tsHA_DimmableLightDevice *psDeviceInfo);
```

Description

This function is used to register an endpoint which will support a Dimmable Light device. The function must be called after the **eHA_Initialise()** function and before starting the ZigBee PRO stack.

The specified identifier for the endpoint is a number in the range 1 to 240 (endpoint 0 is reserved for ZigBee use). HA endpoints are normally numbered consecutively starting at 1. The specified number must be less than or equal to the value of **HA_NUMBER_OF_ENDPOINTS** defined in the **zcl_options.h** file, which represents the highest endpoint number used for HA.

As part of this function call, you must specify a user-defined callback function that will be invoked when an event occurs that is associated with the endpoint (events are detailed in the *ZCL User Guide (JN-UG-3103)*). This callback function is defined according to the typedef:

```
typedef void (* tfpZCL_ZCLCallbackFunction)  
    (tsZCL_CallbackEvent *pCallBackEvent);
```

You must also provide a pointer to a **tsHA_DimmableLightDevice** structure (see [Section 14.2.2](#)) which will be used to store all variables relating to the Dimmable Light device associated with the endpoint. The **sEndPoint** and **sClusterInstance** fields of this structure are set by this function and must not be directly written to by the application.

The function may be called multiple times if more than one endpoint is being used - for example, if more than one Dimmable Light device is housed in the same hardware, sharing the same JN516x module.

Parameters

<i>u8EndPointIdentifier</i>	Endpoint that is to be associated with the registered structure and callback function
<i>cbCallBack</i>	Pointer to the function that the HA library will use to indicate events to the application for this endpoint
<i>psDeviceInfo</i>	Pointer to the structure that will act as storage for all variables related to the device being registered on this endpoint (see Section 14.2.2). The sEndPoint and sClusterInstance fields are set by this register function for internal use and must not be written to by the application

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_PARAMETER_RANGE
E_ZCL_ERR_EP_RANGE
E_ZCL_ERR_CLUSTER_0
E_ZCL_ERR_CALLBACK_NULL

eHA_RegisterColourDimmableLightEndPoint

```
teZCL_Status eHA_RegisterColourDimmableLightEndPoint(  
    uint8 u8EndPointIdentifier,  
    tfpZCL_ZCLCallbackFunction cbCallBack,  
    tsHA_ColourDimmableLightDevice *psDeviceInfo);
```

Description

This function is used to register an endpoint which will support a Colour Dimmable Light device. The function must be called after the **eHA_Initialise()** function and before starting the ZigBee PRO stack.

The specified identifier for the endpoint is a number in the range 1 to 240 (endpoint 0 is reserved for ZigBee use). HA endpoints are normally numbered consecutively starting at 1. The specified number must be less than or equal to the value of **HA_NUMBER_OF_ENDPOINTS** defined in the **zcl_options.h** file, which represents the highest endpoint number used for HA.

As part of this function call, you must specify a user-defined callback function that will be invoked when an event occurs that is associated with the endpoint (events are detailed in the *ZCL User Guide (JN-UG-3103)*). This callback function is defined according to the typedef:

```
typedef void (* tfpZCL_ZCLCallbackFunction)  
    (tsZCL_CallbackEvent *pCallBackEvent);
```

You must also provide a pointer to a **tsHA_ColourDimmableLightDevice** structure (see [Section 14.2.3](#)) which will be used to store all variables relating to the Colour Dimmable Light device associated with the endpoint. The **sEndPoint** and **sClusterInstance** fields of this structure are set by this function and must not be directly written to by the application.

The function may be called multiple times if more than one endpoint is being used - for example, if more than one Colour Dimmable Light device is housed in the same hardware, sharing the same JN516x module.

Parameters

<i>u8EndPointIdentifier</i>	Endpoint that is to be associated with the registered structure and callback function
<i>cbCallBack</i>	Pointer to the function that the HA library will use to indicate events to the application for this endpoint
<i>psDeviceInfo</i>	Pointer to the structure that will act as storage for all variables related to the device being registered on this endpoint (see Section 14.2.3). The sEndPoint and sClusterInstance fields are set by this register function for internal use and must not be written to by the application

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_PARAMETER_RANGE
E_ZCL_ERR_EP_RANGE
E_ZCL_ERR_CLUSTER_0
E_ZCL_ERR_CALLBACK_NULL

eHA_RegisterOnOffLightSwitchEndPoint

```
teZCL_Status eHA_RegisterOnOffLightSwitchEndPoint(  
    uint8 u8EndPointIdentifier,  
    tfpZCL_ZCLCallbackFunction cbCallBack,  
    tsHA_OnOffLightSwitchDevice *psDeviceInfo);
```

Description

This function is used to register an endpoint which will support an On/Off Light Switch device. The function must be called after the **eHA_Initialise()** function and before starting the ZigBee PRO stack.

The specified identifier for the endpoint is a number in the range 1 to 240 (endpoint 0 is reserved for ZigBee use). HA endpoints are normally numbered consecutively starting at 1. The specified number must be less than or equal to the value of **HA_NUMBER_OF_ENDPOINTS** defined in the **zcl_options.h** file, which represents the highest endpoint number used for HA.

As part of this function call, you must specify a user-defined callback function that will be invoked when an event occurs that is associated with the endpoint (events are detailed in the *ZCL User Guide (JN-UG-3103)*). This callback function is defined according to the typedef:

```
typedef void (* tfpZCL_ZCLCallbackFunction)  
    (tsZCL_CallbackEvent *pCallBackEvent);
```

You must also provide a pointer to a **tsHA_OnOffLightSwitchDevice** structure (see [Section 14.2.4](#)) which will be used to store all variables relating to the On/Off Light Switch device associated with the endpoint. The **sEndPoint** and **sClusterInstance** fields of this structure are set by this function and must not be directly written to by the application.

The function may be called multiple times if more than one endpoint is being used - for example, if more than one On/Off Light Switch device is housed in the same hardware, sharing the same JN516x module.

Parameters

<i>u8EndPointIdentifier</i>	Endpoint that is to be associated with the registered structure and callback function
<i>cbCallBack</i>	Pointer to the function that the HA library will use to indicate events to the application for this endpoint
<i>psDeviceInfo</i>	Pointer to the structure that will act as storage for all variables related to the device being registered on this endpoint (see Section 14.2.4). The sEndPoint and sClusterInstance fields are set by this register function for internal use and must not be written to by the application

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_PARAMETER_RANGE
E_ZCL_ERR_EP_RANGE
E_ZCL_ERR_CLUSTER_0
E_ZCL_ERR_CALLBACK_NULL

eHA_RegisterDimmerSwitchEndPoint

```
teZCL_Status eHA_RegisterDimmerSwitchEndPoint(  
    uint8 u8EndPointIdentifier,  
    tfpZCL_ZCLCallbackFunction cbCallBack,  
    tsHA_DimmerSwitchDevice *psDeviceInfo);
```

Description

This function is used to register an endpoint which will support a Dimmer Switch device. The function must be called after the **eHA_Initialise()** function and before starting the ZigBee PRO stack.

The specified identifier for the endpoint is a number in the range 1 to 240 (endpoint 0 is reserved for ZigBee use). HA endpoints are normally numbered consecutively starting at 1. The specified number must be less than or equal to the value of **HA_NUMBER_OF_ENDPOINTS** defined in the **zcl_options.h** file, which represents the highest endpoint number used for HA.

As part of this function call, you must specify a user-defined callback function that will be invoked when an event occurs that is associated with the endpoint (events are detailed in the *ZCL User Guide (JN-UG-3103)*). This callback function is defined according to the typedef:

```
typedef void (* tfpZCL_ZCLCallbackFunction)  
    (tsZCL_CallbackEvent *pCallBackEvent);
```

You must also provide a pointer to a **tsHA_DimmerSwitchDevice** structure (see [Section 14.2.5](#)) which will be used to store all variables relating to the Dimmer Switch device associated with the endpoint. The **sEndPoint** and **sClusterInstance** fields of this structure are set by this function and must not be directly written to by the application.

The function may be called multiple times if more than one endpoint is being used - for example, if more than one Dimmer Switch device is housed in the same hardware, sharing the same JN516x module.

Parameters

<i>u8EndPointIdentifier</i>	Endpoint that is to be associated with the registered structure and callback function
<i>cbCallBack</i>	Pointer to the function that the HA library will use to indicate events to the application for this endpoint
<i>psDeviceInfo</i>	Pointer to the structure that will act as storage for all variables related to the device being registered on this endpoint (see Section 14.2.5). The sEndPoint and sClusterInstance fields are set by this register function for internal use and must not be written to by the application

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_PARAMETER_RANGE
E_ZCL_ERR_EP_RANGE
E_ZCL_ERR_CLUSTER_0
E_ZCL_ERR_CALLBACK_NULL

eHA_RegisterColourDimmerSwitchEndPoint

```
teZCL_Status eHA_RegisterColourDimmerSwitchEndPoint(  
    uint8 u8EndPointIdentifier,  
    tfpZCL_ZCLCallbackFunction cbCallBack,  
    tsHA_DimmerSwitchDevice *psDeviceInfo);
```

Description

This function is used to register an endpoint which will support a Colour Dimmer Switch device. The function must be called after the **eHA_Initialise()** function and before starting the ZigBee PRO stack.

The specified identifier for the endpoint is a number in the range 1 to 240 (endpoint 0 is reserved for ZigBee use). HA endpoints are normally numbered consecutively starting at 1. The specified number must be less than or equal to the value of **HA_NUMBER_OF_ENDPOINTS** defined in the **zcl_options.h** file, which represents the highest endpoint number used for HA.

As part of this function call, you must specify a user-defined callback function that will be invoked when an event occurs that is associated with the endpoint (events are detailed in the *ZCL User Guide (JN-UG-3103)*). This callback function is defined according to the typedef:

```
typedef void (* tfpZCL_ZCLCallbackFunction)  
    (tsZCL_CallbackEvent *pCallBackEvent);
```

You must also provide a pointer to a **tsHA_ColourDimmerSwitchDevice** structure (see [Section 14.2.6](#)) which will be used to store all variables relating to the Colour Dimmer Switch device associated with the endpoint. The **sEndPoint** and **sClusterInstance** fields of this structure are set by this function and must not be directly written to by the application.

The function may be called multiple times if more than one endpoint is being used - for example, if more than one Colour Dimmer Switch device is housed in the same hardware, sharing the same JN516x module.

Parameters

<i>u8EndPointIdentifier</i>	Endpoint that is to be associated with the registered structure and callback function
<i>cbCallBack</i>	Pointer to the function that the HA library will use to indicate events to the application for this endpoint
<i>psDeviceInfo</i>	Pointer to the structure that will act as storage for all variables related to the device being registered on this endpoint (see Section 14.2.6). The sEndPoint and sClusterInstance fields are set by this register function for internal use and must not be written to by the application

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_PARAMETER_RANGE
E_ZCL_ERR_EP_RANGE
E_ZCL_ERR_CLUSTER_0
E_ZCL_ERR_CALLBACK_NULL

eHA_RegisterLightSensorEndPoint

```
teZCL_Status eHA_RegisterLightSensorEndPoint(  
    uint8 u8EndPointIdentifier,  
    tfpZCL_ZCLCallBackFunction cbCallBack,  
    tsHA_LightSensorDevice *psDeviceInfo);
```

Description

This function is used to register an endpoint which will support a Light Sensor device. The function must be called after the **eHA_Initialise()** function and before starting the ZigBee PRO stack.

The specified identifier for the endpoint is a number in the range 1 to 240 (endpoint 0 is reserved for ZigBee use). HA endpoints are normally numbered consecutively starting at 1. The specified number must be less than or equal to the value of **HA_NUMBER_OF_ENDPOINTS** defined in the **zcl_options.h** file, which represents the highest endpoint number used for HA.

As part of this function call, you must specify a user-defined callback function that will be invoked when an event occurs that is associated with the endpoint. This callback function is defined according to the typedef:

```
typedef void (* tfpZCL_ZCLCallBackFunction)  
    (tsZCL_CallBackEvent *pCallBackEvent);
```

You must also provide a pointer to a **tsHA_LightSensorDevice** structure (see [Section 14.2.7](#)) which will be used to store all variables relating to the Light Sensor device associated with the endpoint. The **sEndPoint** and **sClusterInstance** fields of this structure are set by this function and must not be directly written to by the application.

The function may be called multiple times if more than one endpoint is being used - for example, if more than one Light Sensor device is housed in the same hardware, sharing the same JN516x module.

Parameters

<i>u8EndPointIdentifier</i>	Endpoint that is to be associated with the registered structure and callback function
<i>cbCallBack</i>	Pointer to the function that the HA library will use to indicate events to the application for this endpoint
<i>psDeviceInfo</i>	Pointer to the structure that will act as storage for all variables related to the device being registered on this endpoint (see Section 14.2.7). The sEndPoint and sClusterInstance fields are set by this register function for internal use and must not be written to by the application

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_PARAMETER_RANGE
E_ZCL_ERR_EP_RANGE
E_ZCL_ERR_CLUSTER_0
E_ZCL_ERR_CALLBACK_NULL

eHA_RegisterOccupancySensorEndPoint

```
teZCL_Status eHA_RegisterOccupancySensorEndPoint(  
    uint8 u8EndPointIdentifier,  
    tfpZCL_ZCLCallBackFunction cbCallBack,  
    tsHA_OccupancySensorDevice *psDeviceInfo);
```

Description

This function is used to register an endpoint which will support an Occupancy Sensor device. The function must be called after the **eHA_Initialise()** function and before starting the ZigBee PRO stack.

The specified identifier for the endpoint is a number in the range 1 to 240 (endpoint 0 is reserved for ZigBee use). HA endpoints are normally numbered consecutively starting at 1. The specified number must be less than or equal to the value of **HA_NUMBER_OF_ENDPOINTS** defined in the **zcl_options.h** file, which represents the highest endpoint number used for HA.

As part of this function call, you must specify a user-defined callback function that will be invoked when an event occurs that is associated with the endpoint. This callback function is defined according to the typedef:

```
typedef void (* tfpZCL_ZCLCallBackFunction)  
    (tsZCL_CallBackEvent *pCallBackEvent);
```

You must also provide a pointer to a **tsHA_OccupancySensorDevice** structure (see [Section 14.2.8](#)) which will be used to store all variables relating to the Light Sensor device associated with the endpoint. The **sEndPoint** and **sClusterInstance** fields of this structure are set by this function and must not be directly written to by the application.

The function may be called multiple times if more than one endpoint is being used - for example, if more than one Occupancy Sensor device is housed in the same hardware, sharing the same JN516x module.

Parameters

<i>u8EndPointIdentifier</i>	Endpoint that is to be associated with the registered structure and callback function
<i>cbCallBack</i>	Pointer to the function that the HA library will use to indicate events to the application for this endpoint
<i>psDeviceInfo</i>	Pointer to the structure that will act as storage for all variables related to the device being registered on this endpoint (see Section 14.2.8). The sEndPoint and sClusterInstance fields are set by this register function for internal use and must not be written to by the application

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_PARAMETER_RANGE
E_ZCL_ERR_EP_RANGE
E_ZCL_ERR_CLUSTER_0
E_ZCL_ERR_CALLBACK_NULL

eHA_RegisterThermostatEndPoint

```
teZCL_Status eHA_RegisterThermostatEndPoint(  
    uint8 u8EndPointIdentifier,  
    tfpZCL_ZCLCallBackFunction cbCallBack,  
    tsHA_ThermostatDevice *psDeviceInfo);
```

Description

This function is used to register an endpoint which will support a Thermostat device. The function must be called after the **eHA_Initialise()** function and before starting the ZigBee PRO stack.

The specified identifier for the endpoint is a number in the range 1 to 240 (endpoint 0 is reserved for ZigBee use). HA endpoints are normally numbered consecutively starting at 1. The specified number must be less than or equal to the value of **HA_NUMBER_OF_ENDPOINTS** defined in the **zcl_options.h** file, which represents the highest endpoint number used for HA.

As part of this function call, you must specify a user-defined callback function that will be invoked when an event occurs that is associated with the endpoint. This callback function is defined according to the typedef:

```
typedef void (* tfpZCL_ZCLCallBackFunction)  
    (tsZCL_CallBackEvent *pCallBackEvent);
```

You must also provide a pointer to a **tsHA_ThermostatDevice** structure (see [Section 14.3.1](#)) which will be used to store all variables relating to the Thermostat device associated with the endpoint. The **sEndPoint** and **sClusterInstance** fields of this structure are set by this function and must not be directly written to by the application.

The function may be called multiple times if more than one endpoint is being used - for example, if more than one Thermostat device is housed in the same hardware, sharing the same JN516x module.

Parameters

<i>u8EndPointIdentifier</i>	Endpoint that is to be associated with the registered structure and callback function
<i>cbCallBack</i>	Pointer to the function that the HA library will use to indicate events to the application for this endpoint
<i>psDeviceInfo</i>	Pointer to the structure that will act as storage for all variables related to the device being registered on this endpoint (see Section 14.3.1). The sEndPoint and sClusterInstance fields are set by this register function for internal use and must not be written to by the application

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_PARAMETER_RANGE
E_ZCL_ERR_EP_RANGE
E_ZCL_ERR_CLUSTER_0
E_ZCL_ERR_CALLBACK_NULL

eHA_RegisterIASCIEEndPoint

```
teZCL_Status eHA_RegisterIASCIEEndPoint(  
    uint8 u8EndPointIdentifier,  
    tfpZCL_ZCLCallBackFunction cbCallBack,  
    tsHA_IASCIE *psDeviceInfo);
```

Description

This function is used to register an endpoint which will support an IAS Control and Indicating Equipment (CIE) device. The function must be called after the **eHA_Initialise()** function and before starting the ZigBee PRO stack.

The specified identifier for the endpoint is a number in the range 1 to 240 (endpoint 0 is reserved for ZigBee use). HA endpoints are normally numbered consecutively starting at 1. The specified number must be less than or equal to the value of `HA_NUMBER_OF_ENDPOINTS` defined in the **zcl_options.h** file, which represents the highest endpoint number used for HA.

As part of this function call, you must specify a user-defined callback function that will be invoked when an event occurs that is associated with the endpoint. This callback function is defined according to the typedef:

```
typedef void (* tfpZCL_ZCLCallBackFunction)  
    (tsZCL_CallBackEvent *pCallBackEvent);
```

You must also provide a pointer to a `tsHA_IASCIE` structure (see [Section 14.4.1](#)) which will be used to store all variables relating to the IAS CIE device associated with the endpoint. The `sEndPoint` and `sClusterInstance` fields of this structure are set by this function and must not be directly written to by the application.

The function may be called multiple times if more than one endpoint is being used - for example, if more than one IAS CIE device is housed in the same hardware, sharing the same JN516x module.

Parameters

<i>u8EndPointIdentifier</i>	Endpoint that is to be associated with the registered structure and callback function
<i>cbCallBack</i>	Pointer to the function that the HA library will use to indicate events to the application for this endpoint
<i>psDeviceInfo</i>	Pointer to the structure that will act as storage for all variables related to the device being registered on this endpoint (see Section 14.4.1). The <code>sEndPoint</code> and <code>sClusterInstance</code> fields are set by this register function for internal use and must not be written to by the application

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_PARAMETER_RANGE
E_ZCL_ERR_EP_RANGE
E_ZCL_ERR_CLUSTER_0
E_ZCL_ERR_CALLBACK_NULL

eHA_RegisterIASACEEndPoint

```
teZCL_Status eHA_RegisterIASACEEndPoint(  
    uint8 u8EndPointIdentifier,  
    tfpZCL_ZCLCallBackFunction cbCallBack,  
    tsHA_IASACE *psDeviceInfo);
```

Description

This function is used to register an endpoint which will support an IAS Ancillary Control Equipment (ACE) device. The function must be called after the **eHA_Initialise()** function and before starting the ZigBee PRO stack.

The specified identifier for the endpoint is a number in the range 1 to 240 (endpoint 0 is reserved for ZigBee use). HA endpoints are normally numbered consecutively starting at 1. The specified number must be less than or equal to the value of `HA_NUMBER_OF_ENDPOINTS` defined in the **zcl_options.h** file, which represents the highest endpoint number used for HA.

As part of this function call, you must specify a user-defined callback function that will be invoked when an event occurs that is associated with the endpoint. This callback function is defined according to the typedef:

```
typedef void (* tfpZCL_ZCLCallBackFunction)  
    (tsZCL_CallBackEvent *pCallBackEvent);
```

You must also provide a pointer to a `tsHA_IASACE` structure (see [Section 14.4.2](#)) which will be used to store all variables relating to the IAS ACE device associated with the endpoint. The `sEndPoint` and `sClusterInstance` fields of this structure are set by this function and must not be directly written to by the application.

The function may be called multiple times if more than one endpoint is being used - for example, if more than one IAS ACE device is housed in the same hardware, sharing the same JN516x module.

Parameters

<i>u8EndPointIdentifier</i>	Endpoint that is to be associated with the registered structure and callback function
<i>cbCallBack</i>	Pointer to the function that the HA library will use to indicate events to the application for this endpoint
<i>psDeviceInfo</i>	Pointer to the structure that will act as storage for all variables related to the device being registered on this endpoint (see Section 14.4.2). The <code>sEndPoint</code> and <code>sClusterInstance</code> fields are set by this register function for internal use and must not be written to by the application

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_PARAMETER_RANGE
E_ZCL_ERR_EP_RANGE
E_ZCL_ERR_CLUSTER_0
E_ZCL_ERR_CALLBACK_NULL

eHA_RegisterIASZoneEndPoint

```
teZCL_Status eHA_RegisterIASZoneEndPoint(  
    uint8 u8EndPointIdentifier,  
    tfpZCL_ZCLCallBackFunction cbCallBack,  
    tsHA_IASZoneDevice *psDeviceInfo);
```

Description

This function is used to register an endpoint which will support an IAS Zone device. The function must be called after the **eHA_Initialise()** function and before starting the ZigBee PRO stack.

The specified identifier for the endpoint is a number in the range 1 to 240 (endpoint 0 is reserved for ZigBee use). HA endpoints are normally numbered consecutively starting at 1. The specified number must be less than or equal to the value of **HA_NUMBER_OF_ENDPOINTS** defined in the **zcl_options.h** file, which represents the highest endpoint number used for HA.

As part of this function call, you must specify a user-defined callback function that will be invoked when an event occurs that is associated with the endpoint. This callback function is defined according to the typedef:

```
typedef void (* tfpZCL_ZCLCallBackFunction)  
    (tsZCL_CallBackEvent *pCallBackEvent);
```

You must also provide a pointer to a **tsHA_IASZoneDevice** structure (see [Section 14.4.3](#)) which will be used to store all variables relating to the IAS Zone device associated with the endpoint. The **sEndPoint** and **sClusterInstance** fields of this structure are set by this function and must not be directly written to by the application.

The function may be called multiple times if more than one endpoint is being used - for example, if more than one IAS Zone device is housed in the same hardware, sharing the same JN516x module.

Parameters

<i>u8EndPointIdentifier</i>	Endpoint that is to be associated with the registered structure and callback function
<i>cbCallBack</i>	Pointer to the function that the HA library will use to indicate events to the application for this endpoint
<i>psDeviceInfo</i>	Pointer to the structure that will act as storage for all variables related to the device being registered on this endpoint (see Section 14.4.3). The sEndPoint and sClusterInstance fields are set by this register function for internal use and must not be written to by the application

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL
E_ZCL_ERR_PARAMETER_NULL
E_ZCL_ERR_PARAMETER_RANGE
E_ZCL_ERR_EP_RANGE
E_ZCL_ERR_CLUSTER_0
E_ZCL_ERR_CALLBACK_NULL

eHA_RegisterIASWarningDeviceEndPoint

```
teZCL_Status eHA_RegisterIASWarningDeviceEndPoint(  
    uint8 u8EndPointIdentifier,  
    tfpZCL_ZCLCallbackFunction cbCallBack,  
    tsHA_IASWarningDevice *psDeviceInfo);
```

Description

This function is used to register an endpoint which will support an IAS Warning Device (WD). The function must be called after the **eHA_Initialise()** function and before starting the ZigBee PRO stack.

The specified identifier for the endpoint is a number in the range 1 to 240 (endpoint 0 is reserved for ZigBee use). HA endpoints are normally numbered consecutively starting at 1. The specified number must be less than or equal to the value of **HA_NUMBER_OF_ENDPOINTS** defined in the **zcl_options.h** file, which represents the highest endpoint number used for HA.

As part of this function call, you must specify a user-defined callback function that will be invoked when an event occurs that is associated with the endpoint. This callback function is defined according to the typedef:

```
typedef void (* tfpZCL_ZCLCallbackFunction)  
    (tsZCL_CallbackEvent *pCallBackEvent);
```

You must also provide a pointer to a **tsHA_IASWarningDevice** structure (see [Section 14.4.4](#)) which will be used to store all variables relating to the IAS WD associated with the endpoint. The **sEndPoint** and **sClusterInstance** fields of this structure are set by this function and must not be directly written to by the application.

The function may be called multiple times if more than one endpoint is being used - for example, if more than one IAS WD is housed in the same hardware, sharing the same JN516x module.

Parameters

<i>u8EndPointIdentifier</i>	Endpoint that is to be associated with the registered structure and callback function
<i>cbCallBack</i>	Pointer to the function that the HA library will use to indicate events to the application for this endpoint
<i>psDeviceInfo</i>	Pointer to the structure that will act as storage for all variables related to the device being registered on this endpoint (see Section 14.4.4). The sEndPoint and sClusterInstance fields are set by this register function for internal use and must not be written to by the application

Returns

E_ZCL_SUCCESS
E_ZCL_FAIL

14. HA Device Structures

This chapter presents the shared device structures for the HA devices supported by the HA API. The supported HA devices are introduced in [Chapter 2](#).

Within each shared device structure, there is a section for each cluster supported by the device, where each of these sections has one or more of the following elements:

- Pointer to the cluster
- Data structure(s) for the cluster

The section for each optional cluster is enabled by a corresponding enumeration defined in the **zcl_options.h** file (e.g. CLD_SCENES for the Scenes cluster). Another enumeration is also used which determines whether the cluster will act as a server or client (e.g. SCENES_SERVER for a Scenes cluster server). Refer to [Section 3.5.1](#).

14.1 Generic Devices

The structures for the following Generic Devices are presented in this section:

- On/Off Switch (tsHA_OnOffSwitchDevice) - see [Section 14.1.1](#)
- On/Off Output (tsHA_OnOffOutputDevice) - see [Section 14.1.2](#)
- Remote Control (tsHA_RemoteControlDevice) - see [Section 14.1.4](#)
- Door Lock (tsHA_DoorLockDevice) - see [Section 14.1.4](#)
- Door Lock Controller (tsHA_DoorLockControllerDevice) - see [Section 14.1.5](#)
- Simple Sensor (tsHA_SimpleSensorDevice) - see [Section 14.1.6](#)
- Smart Plug (tsHA_SmartPlugDevice) - see [Section 14.1.7](#)

14.1.1 tsHA_OnOffSwitchDevice

The following tsHA_OnOffSwitchDevice structure is the shared structure for an On/Off Switch device:

```
typedef struct
{
    tsZCL_EndPointDefinition sEndPoint;

    /* Cluster instances */
    tsHA_OnOffSwitchDeviceClusterInstances sClusterInstance;

    #if (defined CLD_BASIC) && (defined BASIC_SERVER)
        /* Basic Cluster - Server */
        tsCLD_Basic sBasicServerCluster;
    #endif
}
```

Chapter 14

HA Device Structures

```
#if (defined CLD_IDENTIFY) && (defined IDENTIFY_SERVER)
    /* Identify Cluster - Server */
    tsCLD_Identify sIdentifyServerCluster;
    tsCLD_IdentifyCustomDataStructure sIdentifyServerCustomDataStructure;
#endif

#if (defined CLD_OOSC) && (defined OOSC_SERVER)
    /* On/Off Switch Configuration Cluster - Server */
    tsCLD_OnOff sOOSCServerCluster;
#endif

    /* Optional server clusters */
#if (defined CLD_POWER_CONFIGURATION) && (defined
POWER_CONFIGURATION_SERVER)
    /* Power Configuration Cluster - Server */
    tsCLD_PowerConfiguration sPowerConfigServerCluster;
#endif

#if (defined CLD_DEVICE_TEMPERATURE_CONFIGURATION) && (defined
DEVICE_TEMPERATURE_CONFIGURATION_SERVER)
    /* Device Temperature Configuration Cluster - Server */
    tsCLD_DeviceTemperatureConfiguration
sDeviceTemperatureConfigurationServerCluster;
#endif

#if (defined CLD_ALARMS) && (defined ALARMS_SERVER)
    /* Alarms Cluster - Server */
    tsCLD_Alarms sAlarmsServerCluster;
    tsCLD_AlarmsCustomDataStructure sAlarmsServerCustomDataStructure;
#endif

#if (defined CLD_POLL_CONTROL) && (defined POLL_CONTROL_SERVER)
    tsCLD_PollControl sPollControlServerCluster;
    tsCLD_PollControlCustomDataStructure
sPollControlServerCustomDataStructure;
#endif

    /* Mandatory client clusters */
#if (defined CLD_SCENES) && (defined SCENES_CLIENT)
    /* Scenes Cluster - Client */
    tsCLD_ScenesCustomDataStructure sScenesClientCustomDataStructure;
#endif

#if (defined CLD_GROUPS) && (defined GROUPS_CLIENT)
    /* Groups Cluster - Client */
    tsCLD_GroupsCustomDataStructure sGroupsClientCustomDataStructure;
#endif

#if (defined CLD_IDENTIFY) && (defined IDENTIFY_CLIENT)
    /* Identify Cluster - Client */
```

```

        tsCLD_IdentifyCustomDataStructure sIdentifyClientCustomDataStructure;
    #endif

    /* Optional client clusters */

    #if (defined CLD_POLL_CONTROL) && (defined POLL_CONTROL_CLIENT)
        tsCLD_PollControlCustomDataStructure
        sPollControlClientCustomDataStructure;
    #endif

    #ifndef CLD_OTA
        /* OTA cluster */
        #ifndef OTA_CLIENT
            tsCLD_AS_Ota sCLD_OTA;
            tsOTA_Common sCLD_OTA_CustomDataStruct;
        #endif

        #ifndef OTA_SERVER
            tsOTA_Common sCLD_OTA_ServerCustomDataStruct;
        #endif
    #endif

    #if (defined CLD_ELECTRICAL_MEASUREMENT && defined
    ELECTRICAL_MEASUREMENT_SERVER)
        tsCLD_ElectricalMeasurement sCLD_ElectricalMeasurement;
    #endif
} tsHA_OnOffSwitchDevice;

```

14.1.2 tsHA_OnOffOutputDevice

The following tsHA_OnOffOutputDevice structure is the shared structure for an On/Off Output device:

```

typedef struct
{
    tsZCL_EndPointDefinition sEndPoint;

    /* Cluster instances */
    tsHA_OnOffOutputDeviceClusterInstances sClusterInstance;

    /* Mandatory server clusters */
    #if (defined CLD_BASIC) && (defined BASIC_SERVER)
        /* Basic Cluster - Server */
        tsCLD_Basic sBasicServerCluster;
    #endif

    #if (defined CLD_IDENTIFY) && (defined IDENTIFY_SERVER)
        /* Identify Cluster - Server */
        tsCLD_Identify sIdentifyServerCluster;
        tsCLD_IdentifyCustomDataStructure sIdentifyServerCustomDataStructure;
    #endif
}

```

Chapter 14

HA Device Structures

```
#endif

#if (defined CLD_ONOFF) && (defined ONOFF_SERVER)
    /* On/Off Cluster - Server */
    tsCLD_OnOff sOnOffServerCluster;
    tsCLD_OnOffCustomDataStructure sOnOffServerCustomDataStructure;
#endif

#if (defined CLD_SCENES) && (defined SCENES_SERVER)
    /* Scenes Cluster - Server */
    tsCLD_Scenes sScenesServerCluster;
    tsCLD_ScenesCustomDataStructure sScenesServerCustomDataStructure;
#endif

#if (defined CLD_GROUPS) && (defined GROUPS_SERVER)
    /* Groups Cluster - Server */
    tsCLD_Groups sGroupsServerCluster;
    tsCLD_GroupsCustomDataStructure sGroupsServerCustomDataStructure;
#endif

    /* Optional server clusters */
#if (defined CLD_POWER_CONFIGURATION) && (defined
POWER_CONFIGURATION_SERVER)

14.2 Lighting Devices

The structures for the following Lighting Devices are presented in this section:

- On/Off Light (tsHA_OnOffLightDevice) - see [Section 14.2.1](#)
- Dimmable Light (tsHA_DimmableLightDevice) - see [Section 14.2.2](#)
- Colour Dimmable Light (tsHA_ColourDimmableLightDevice) - see [Section 14.2.3](#)
- On/Off Light Switch (tsHA_DimmableLightDevice) - see [Section 14.2.4](#)
- Dimmer Switch (tsHA_DimmerSwitchDevice) - see [Section 14.2.5](#)
- Colour Dimmer Switch (tsHA_ColourDimmerSwitchDevice) - see [Section 14.2.6](#)
- Light Sensor (tsHA_LightSensorDevice) - see [Section 14.2.7](#)
- Occupancy Sensor (tsHA_OccupancySensorDevice) - see [Section 14.2.8](#)

14.2.1 tsHA_OnOffLightDevice

The following tsHA_OnOffLightDevice structure is the shared structure for an On/Off Light device:

```
typedef struct
{
    tsZCL_EndPointDefinition sEndPoint;

    /* Cluster instances */
    tsHA_OnOffLightDeviceClusterInstances sClusterInstance;

    /* Mandatory server clusters */
    #if (defined CLD_BASIC) && (defined BASIC_SERVER)
        /* Basic Cluster - Server */
        tsCLD_Basic sBasicServerCluster;
    #endif

    #if (defined CLD_IDENTIFY) && (defined IDENTIFY_SERVER)
        /* Identify Cluster - Server */
        tsCLD_Identify sIdentifyServerCluster;
        tsCLD_IdentifyCustomDataStructure sIdentifyServerCustomDataStructure;
    #endif

    #if (defined CLD_ONOFF) && (defined ONOFF_SERVER)
        /* On/Off Cluster - Server */
        tsCLD_OnOff sOnOffServerCluster;
        tsCLD_OnOffCustomDataStructure sOnOffServerCustomDataStructure;
    #endif

    #if (defined CLD_SCENES) && (defined SCENES_SERVER)
        /* Scenes Cluster - Server */
```

```

        tsCLD_Scenes sScenesServerCluster;
        tsCLD_ScenesCustomDataStructure sScenesServerCustomDataStructure;
    #endif

    #if (defined CLD_GROUPS) && (defined GROUPS_SERVER)
        /* Groups Cluster - Server */
        tsCLD_Groups sGroupsServerCluster;
        tsCLD_GroupsCustomDataStructure sGroupsServerCustomDataStructure;
    #endif

        /* Optional server clusters */
    #if (defined CLD_POWER_CONFIGURATION) && (defined
POWER_CONFIGURATION_SERVER)
        /* Power Configuration Cluster - Server */
        tsCLD_PowerConfiguration sPowerConfigServerCluster;
    #endif

    #if (defined CLD_DEVICE_TEMPERATURE_CONFIGURATION) && (defined
DEVICE_TEMPERATURE_CONFIGURATION_SERVER)
        /* Device Temperature Configuration Cluster - Server */
        tsCLD_DeviceTemperatureConfiguration
sDeviceTemperatureConfigurationServerCluster;
    #endif

    #if (defined CLD_ALARMS) && (defined ALARMS_SERVER)
        /* Alarms Cluster - Server */
        tsCLD_Alarms sAlarmsServerCluster;
        tsCLD_AlarmsCustomDataStructure sAlarmsServerCustomDataStructure;
    #endif

Part IV: Appendices

A. Custom Endpoints

An HA device and its associated clusters can be registered on an endpoint using the relevant device registration function, from those listed and described in [Chapter 13](#). However, it is also possible to set up a custom endpoint which supports selected clusters (rather than a whole HA device and all of its associated clusters). Custom endpoints are particularly useful when using multiple endpoints on a single node - for example, the first endpoint may support a complete HA device (such as a Light Sensor) while one or more custom endpoints are used to support selected clusters.

A.1 HA Devices and Endpoints

When using custom endpoints, it is important to note the difference between the following HA 'devices':

- **Physical device:** This is the physical entity which is the HA network node
- **Logical HA device:** This is a software entity which implements a specific set of HA functionality on the node, e.g. On/Off Switch device

An HA network node may contain multiple endpoints, where one endpoint is used to represent the 'physical device' and other endpoints are used to support 'logical HA devices'. The following rules apply to cluster instances on endpoints:

- All cluster instances relating to a single 'logical HA device' must reside on a single endpoint.
- The Basic cluster relates to the 'physical device' rather than a 'logical HA device' instance. There can be only one Basic cluster server for the entire node, which can be implemented in either of the following ways:
 - A single cluster instance on a dedicated 'physical device' endpoint
 - A separate cluster instance on each 'logical HA device' endpoint, but each cluster instance must use the same `tsZCL_ClusterInstance` structure (and the same attribute values)

A.2 Cluster Creation Functions

For each of the following clusters, a creation function is provided which creates an instance of the cluster on an endpoint:

- Basic: **eCLD_BasicCreateBasic()**
- Power Configuration: **eCLD_PowerConfigurationCreatePowerConfiguration()**
- Identify: **eCLD_IdentifyCreateIdentify()**
- Groups: **eCLD_GroupsCreateGroups()**
- Scenes: **eCLD_ScenesCreateScenes()**
- On/Off: **eCLD_OnOffCreateOnOff()**
- On/Off Switch Configuration: **eCLD_OOSCCreateOnOffSwitchConfig()**
- Level Control: **eCLD_LevelControlCreateLevelControl()**
- Time: **eCLD_TimeCreateTime()**
- Binary Input (Basic): **eCLD_BinaryInputBasicCreateBinaryInputBasic()**
- Door Lock: **eCLD_DoorLockCreateDoorLock()**
- Thermostat: **eCLD_ThermostatCreateThermostat()**
- Thermostat User Interface Configuration:
eCLD_ThermostatUIConfigCreateThermostatUIConfig()
- Colour Control: **eCLD_ColourControlCreateColourControl()**
- Illuminance Measurement:
eCLD_IlluminanceMeasurementCreateIlluminanceMeasurement()
- Illuminance Level Sensing:
eCLD_IlluminanceLevelSensingCreateIlluminanceLevelSensing()
- Temperature Measurement:
eCLD_TemperatureMeasurementCreateTemperatureMeasurement()
- Relative Humidity Measurement:
eCLD_RelativeHumidityMeasurementCreateRelativeHumidityMeasurement()
- Occupancy Sensing: **eCLD_OccupancySensingCreateOccupancySensing()**
- IAS Zone: **eCLD_IASZoneCreateIASZone()**
- IAS Ancillary Control Equipment (ACE): **eCLD_IASACECreateIASACE()**
- IAS Warning Device (WD): **eCLD_IASWDCreateIASWD()**
- Price: **eSE_PriceCreate()**
- Demand-Response and Load Control (DRLC): **eSE_DRLCCreate()**
- Simple Metering: **eSE_SMCreate()**
- Appliance Control: **eCLD_ApplianceControlCreateApplianceControl()**
- Appliance Identification:
eCLD_ApplianceIdentificationCreateApplianceIdentification()
- Appliance Events and Alerts:
eCLD_ApplianceEventsAndAlertsCreateApplianceEventsAndAlerts()
- Appliance Statistics: **eCLD_ApplianceStatisticsCreateApplianceStatistics()**
- Diagnostics: **eCLD_DiagnosticsCreateDiagnostics()**
- Over-The-Air (OTA) Upgrade: **eOTA_Create()**

More than one of the above functions can be called for the same endpoint in order to create multiple cluster instances on the endpoint.

Note: No more than one server instance and one client instance of a given cluster can be created on a single endpoint (e.g. one Identify cluster server and one Identify cluster client, but no further Identify cluster instances).

The creation functions for clusters from the ZCL are described in the *ZCL User Guide (JN-UG-3103)*. The creation functions for clusters from the SE profile are described in the *ZigBee Smart Energy User Guide (JN-UG-3059)*. The creation functions for the remaining HA-specific clusters are described in the chapters for the corresponding clusters in this manual.

A.3 Custom Endpoint Set-up

In order to set up a custom endpoint (supporting selected clusters), you must do the following in your application code:

1. Create a structure for the custom endpoint containing details of the cluster instances and attributes supported - see [Custom Endpoint Structure](#) below.
2. Initialise the fields of the `tsZCL_EndPointDefinition` structure for the endpoint.
3. Call the relevant cluster creation function(s) for the cluster(s) to be supported on the endpoint - see [Appendix A.2](#).
4. Call the ZCL function **eZCL_Register()** for the endpoint.

Custom Endpoint Structure

In your application code, to set up a custom endpoint you must create a structure containing details of the cluster instances and attributes to be supported on the endpoint. This structure must include the following:

- A definition of the custom endpoint through a `tsZCL_EndPointDefinition` structure - for example:

```
tsZCL_EndPointDefinition sEndPoint
```

- A structure containing a set of `tsZCL_ClusterInstance` structures for the supported cluster instances - for example:

```
typedef struct
{
    tsZCL_ClusterInstance sBasicServer;
    tsZCL_ClusterInstance sBasicClient;
    tsZCL_ClusterInstance sIdentifyServer;
    tsZCL_ClusterInstance sOnOffCluster;
    tsZCL_ClusterInstance sDoorLockCluster;
} tsHA_AppCustomDeviceClusterInstances
```

For each cluster instance that is not shared with another endpoint, the following should be specified via the relevant `tsZCL_ClusterInstance` structure:

- Attribute definitions, if any - for example, the `tsCLD_Basic` structure for the Basic cluster
- Custom data structures, if any - for example, the `tsIdentify_CustomStruct` structure for the Identify cluster
- Memory for tables or any other resources, if required by the cluster creation function

Note: If a custom endpoint is to co-exist with a device endpoint, the endpoints can share the structures for the clusters that they have in common. Therefore, it is not necessary to define these cluster structures for the custom endpoint, since they already exist for the device endpoint.

Revision History

Version	Date	Comments
1.0	10-June-2013	First release
1.1	22-Oct-2013	Poll Control and Power Profile clusters added
1.2	24-Sept-2014	Added the following devices: Smart Plug, Thermostat, IAS (CIE, ACE, WD and Zone). Minor updates made to Poll Control cluster and Application Statistics cluster
1.3	20-Feb-2015	Added Electrical Measurement cluster. Updated for change of tool-chain to 'BeyondStudio for NXP' and for optimised ZCL supplied in new combined HA/ZLL SDK. Part numbers for related resources changed: <ul style="list-style-type: none"> • ZigBee PRO Stack User Guide: JN-UG-3048 to JN-UG-3101 • ZCL User Guide: JN-UG-3077 to JN-UG-3103 • JN516x Toolchain installer: JN-SW-4041 to JN-SW-4141 • JN516x HA SDK installer: JN-SW-4067 to JN-SW-4168
1.4	3-Aug-2016	Web addresses for NXP Wireless Connectivity pages updated

Important Notice

Limited warranty and liability - Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

Right to make changes - NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use - NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications - Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Export control - This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.
